(Nuttall, 1818), named in honor of Časpar Wistur, an American anatomist (1761–1818).] 1. A genus of leguminous plants, of the tribe Galegeæ and subtribe Tephrosieæ. It is characterized hy having papilionaceous flowers in terminal racemes, with a smooth style and stamens usually completely diadelphous, and by a coriaceous readily dehiscent legume, the last character separating it from the large tropical Old World genus Milletia. There are 2 or 3 species, natives of North America, China, and Japan. They are lofty climbing shrubs with odd-pinnate leaves, entire festher-veined and reticulated leaflets, and small stipules. The handsome purplish flowers form terminal pendent racemes. They are much cultivated in America, commonly under the generic name (sometimes erroneously Wisteria); in England they are often known as kidney-bean tree, in Australia as grape-flower vine. W. Chinensis, the Chinese, and W. frutescens, the American wistaria, are much used in the United States to cover verandas and walls. The latter is a native of swamp-margins from Virginia to Illinois and southward, and develops its flowers at the same time with the leaves, instead of before them, as in W. Chinensis. W. Japonica, by some thought not a distinct species, is commonly trained in Japan horizontally on trellises over pleasure-seats as an ornamental shade; it sometimes lives more than a century.

2. [l. c.] A plant of this genus.

Imagination; the imaginative faculty. [Rare.]

Wit in the poet... is no other than the faculty of imagination in the writer, which . . . searches over all the memory for the species or ideas of those things which it designs to represent,

Dryden, Annus Mirabilis, Tó Sir R. Howard.

The keen perception and apt expression of those connections between ideas which awaken

pleasure and especially amusement. See the quotations and the synonyms.

True wit consists in the resemblance of ideas. . . But every resemblance of ideas is not what we call wit, and it must be such an one that gives delight and surprise to the reader. Where the likeness is obvious, it creates no surprise, and is not wit. Thus, when a poet tells us that the bosom of his mistress is as white as snow, there is no wit in the comparison; but when he adds, with a sigh, it is as cold too, it then grows into wit.

Dryden.

Wit lying most in the assemblage of ideas, and putting those together with quickness and variety wherein can be found any resemblance or congruity, thereby to make up pleasant pictures and agreeable visions in the fancy.

=Syn. 6. Wit, Humor. In writers down to the time of Pope wit generally meant the serious kind of wit.

Serious wit is . . . nelther more nor less than quick wisdom.

Burnet.

Look, he's winding up the watch of hls wit; by and by will strike.

Shak., Tempest, li. 1. 13.

Look, he's winding up the watch of his wit; by and by it will strike.

Shak., Tempest, li. 1. 13.

In more recent use wit in the singular generally implies comic wit; in that sense it is different from humor. One principal difference is that wit always lies in some form of words, while humor may be expressed by manner, as a smile, a grimace, an attitude. Underlying this is the fact, consistent with the original meaning of the words, that humor goes more deeply into the nature of the thought, while wit catches pleasing but occult or farfetched resemblances between things really unlike: a good pun shows wit; Irving's "History of New York" is a piece of sustained humor, the humor lying in the portrayal of character, the nature of the incidents, etc. Again, "Wit may, I think, be regarded as a purely intellectual process, while humor is a sense of the ridleulous controlled by feeling, and coexistent often with the gentlest and deepest pathos" (II. Reed, Lects. on Eng. Lit., II. 357). Hence humor is always kind, while wit may be unkind in the extreme: Swift's "Travels of Gulliver" is much too severe a satire to be called a work of humor. It is essential to the effect of wit that the form in which it is expressed should be brief; humor may be heightened in its effect by expansion loto full forms of statement, description, etc. Wit more often than humor depends upon passing circumstances for its effect.

The best and most agreeable specimen of English humor (it is humar in contrast to any which held-end.)

The best and most agreeable specimen of English humor (it is humor in contrast to wit) which belongs to that period is Steele's Invention, and Addison's use, of the character of Sir Roger de Coverley. . . . The same species of pure, genial, wise, and healthful humor has been sustained in the incomparable "Vicar of Wakefield," and in the writings of our countryman Washington Irving, H. Reed, Lects. on Eng. Lit., II. 369.

While wit is a purely intellectual thing, into every act of the humorous mind there is an influx of the moral nature; rays, direct or retracted, from the will and the affections, from the disposition and the temperament, enter into all humor; and thence it is that humor is of a diffusive quality, pervading an entire course of thought; while wit—because it has no existence apart from certain logical relations of thought which are definitely assignable, and can be counted even—is always punctually concentrated within the circle of a few words. De Quincey.

Dr. Trusler says that wit relates to the matter, humour to the manner; that our old comedies abounded with wit, and our old actors with humour; that humour slways excites laughter but wit does not; that a fellow of humour will set a whole company In a roar, but that there is a smartness in wit which cuts white it pleases. Wit, he adds, always implies sense and abilities, while humour does not; humour is chiefly relished by the vulgar, but education is requisite to comprehend wit.

Fleming, Vocab. Philos.

It is no uncommon thing to hear "He has humour rather than wit." Here the expression commonly means pleasantry; for whoever has humour has wit, although it does not follow that whoever has wit has humour. Humour is wit appertaining to character, and Indulges In breadth of drollery rather than in play and brilliancy of point. Wit vibrates and spirts; humour springs up exuberantly as from a Iountain and ruos on. In Congreve you wonder what he will say next; in Addison you repose on what Is said, listening with assured expectation of something congenial and pertinent.

Small record for Fenerica many abouted line.

Small room for Fancy's many chorded lyre,
For Wit's bright rockets with their trains of fire.
O. W. Holmes, An After-Dinner Poem.

I am not speaking of the fun of the book [Don Quixote], of which there is plenty, and sometimes boisterons enough, but of that deeper and more delicate quality, suggestive of remote analogies and essential incongruities, which alone deserves the name of humor. Lovell, Don Quixote.

[AS. witena gemōt, 'counselors' moot': witena, gen. pl. of wita, weota, gewita, a man of knowledge, a counselor; gemōt, moot or meet, assembly, council, parliament: see wit² and moot¹.] In Anglo-Saxon hist., the great national council or parliament, consisting of the king with his dependents and friends and sometimes the mempendents and friends and sometimes the members of his family, the ealdormen, the bishops, and other ecclesiastics. This council, which met frequently, constituted the highest court of judicature in the kingdom. It was summoned by the king in any political emergency, and its concurrence was necessary in many hipportant measures, such as the deciding of war, the levying of extraordinary taxes, grants of land in certain cases, election and (in many instances) deposition of kings. of kings.

The old Germanic tradition, which associated "the wise men" in all royal action, gave a constitutional ground to the powers which the Witenagemot exercised more and more as English society took a more and more aristocratic form; and it thus came to share with the crown in the higher justice, in the imposition of taxes, the making of laws, the conclusion of treaties, the control of war, the disposal of public lands, the appointment of bishops and great officers of state. There were times when it claimed even to elect or depose a king.

wolf (wulf), n.; pl. wolves (wulvz). [ME. wolf, pus, of the lupine or thooid series of Canidæ; hence, some similar animal. The common wolf of Europe, etc., is yellowish or fulvous-gray, with harsh strong hair, creet pointed ears, and the tsil straight or nearly so. The height at the shoulder is from 27 to 29 inches. Wolves are swift of foot, crafty, and rspacious, and destructive enemies to the sheep-cote and farm-yard; they associate in packs to hunt the larger quadrupeds, as the deer, the elk, etc. When hard pressed with hunger these packs not infrequently stack isolated travelers, and have been known even to enter villages and earry of children. In general, however, wolves are cowardly and stealthy, approaching sheepfolds and farm-buildings only at dead of night, making a rapid retreat if in the least dis-

turhed by a dog or a man, and exhibiting great eunning in the avoidance of traps. Wolves are still numerous in some parts of Europe, as France, Ilungary, Spain, Turkey, and Russia; they probably eeased to exist in England about the end of the fifteenth century; and in Scotland in the first part of the eighteenth century; the latter date probably marks also the disappearance of wolves in Ireland. The wolves of North America are of two very distinct species. One of these is scarcely different from the European, but is generally regarded as a variety, under the name of C. l. occidentatis. The usual color is a grizzled gray, but it sports in many colors, as reddish and blackish. Mostrains of the American wolf are larger and stouter than those of Europe. The gray wolf is also called the buffaloud, from its former abundance in the buffalorange, and timber-wolf, so distinguished from the prairie-wolf or coyote, Camis latrans, a much smaller and very different animal, which lives chiefly in open country, in burrows in the ground, and in some respects resembles the jackal. (See coyote, with cut.) Yet other wolves, of rather numerous species, inhabit most parts of the world; some grade into jackals (see Thous), others toward foxes (see fox-wolf); and most of them interbreed easily with some varieties of the dog of the countries they respectively inhabit, the dog itself being a composite of a mixed wolf sneestry (see wolf-dog, 2).

Wonderful Parliament. Same as Merciless Parliament (which see, under parliament) = Syn. Wonderful, Stronge, Surprising, Curious, Unique, extraordinary, marvelous, amazing, startling, wondrons (poetic). Wonderful generally refers to something above the common, and so marvelous, perhaps almost incredible. Strangerefers rather to something beside the common—that is, simply very nnusual or odd, and so exciting surprise or wonder. Anything that excites awe or high admiration, or strikes one as sublime, is wonderful; an unpleasant object may be strange, but would not be called wonderful. That which is unexpected is surprising, but it is not necessarily strange: as, a surprising fact; a surprising discovery in science. Curious is wonderful on a small scale; by its derivation it often refers to an object extremely nice and intricate or elaborate in its details, but also it often conveys the notion of pleasing strangeness and even of rarity: as, a curious bit of mosaic; a curious piece of mechanism; a curious bit of mosaic; a curious piece of mechanism; a curious kind or quality: as, a unique book; a unique sort of person. See eccentric and surprise.

teemed as a game-bird, its flesh being delicious, while the thick cover it inhabits and the rapidity of its flight test the nerve and skill of the sportsman. It is migratory, breeding chiefly in the higher latitudes, nesting upon the ground in a dry spot under cover, and laying four eggs. This woodcock is over 12 inches in length, and weighs from 10 to 15 onnees; the plumage is intimately variegated with brown, black, russet, and tawny. It is seldom seen in America, and only as a straggler from Europe. (b) In the United States and Canada, Philohela minor, a bird of the same general characteristics as the former, but smaller, notally under 12 inches in length, and weighing 9 onnees or less; the under parts are whole-colored, and there is a generic difference from Scolopax rusticula in the

structure of the outer primaries, three of which are attenuated and abbreviated in Philobela. The sexes are alike in color, but the female is considerably larger than the male, and alone reaches the maximum size and weight above given; the male is usually 10 to 11 inches long, and 16 to 17 in spread, weighing 5, 6, or 7 ounces according to condition. The bill is perfectly straight, 2½ to 3 inches long, and deeply furrowed; it is a very sensitive probe, with which the bird feels for worms in the mud by thrusting it in for its full length. The physiognomy of the woodcock is peculiar, by reason of the shape of the head, and the great size of the dark eyes, as well as their site high up and far hack. The wings are short and rounded, but ample; the tail is very short, rounded, and usually held up; the legs are feathered to the heel, naked beyond; the toes are cleft quite to the base; there is a small hind toe, and the middle toe with its claw is rather longer than the tarsus. The woodcock is to some extent a nocturnal bird. It abounds in most of its range, and is one of the leading game-birds of America; it is found in bogs and swamps, wet woodlands, alder-brakes (sometimes called woodcock-brakes in consequence), and not seldom in quite dry fields, as corn-fields; it is migratory, but erratic and capricious in its movements, and nests throughout its

The woodcock has a peculiar bleating cry, and sometimes exhibits the curious habit of removing the young from danger by flying off with the chick, which is held in the parent's feet. Wood-engraving (wùd'en-grā"ving), n. 1. The art or process of cutting designs in relief upon blocks of wood, usually box, so that impressions can be made from them with a pigment in a printing-press upon paper or other masions can be made from them with a pigment in a printing-press, upon paper or other material. For cuts of more than 5 or 6 inches square, two or more blocks are firmly secured together. The surface of the smoothed block, which is cut directly across the grain, is prepared for the engraver by rubbing it with pounded Bath brick mixed with a little water, in order to give a hold to the lead-pencil, and the subject is drawn in with pencil or India ink, or is transferred upon the block by photography. The engraver then, by means of gravers, tint-tools, gouges or scrapers, and flat tools or chisels of different sizes, cuts out the design, leaving it in raised lines or dots upon the surface of the block, so that these may receive the ink and yield the desired impression under the action of the press. In such parts of the design as are to be solid black, the engraver leaves the surface of the wood untouched; in such parts as are to be wholly white, he cuts the surface on triefly away; the large number of tones, technically called tints, between these extremes are rendered by cutting out wider or narrower spaces, corresponding to white paper in the print, between the lines or dots left in relief. An engraving is seldom a mere reproduction of the copy; it is a translation, into which the personal element of the engraver enters: thus the engraving may be either superior or inferior artistically to the original. Wood-engraving is technically the opposite of steel- or copperplate-engraving: in the latter the lines out by the engraver form the picture; in the former the parts of the surface left uncut form the picture.

Addison, tr. of Virgil's Georgies, iv.

Any bird of the woodpecker (wùd'pek"er), n. large family Pieidæ, of which there are numerous genera and some 250 species, inhabiting nearly all parts of the world. They are picarian and seansorial birds, having the toes arranged in pairs, two before and two behind (except, of course, in the three-toed genera: see Picoides), and cut under Tien); the tail-feathers rigid and acuminate, to assist in climbing; the bill hard and chisel-like, adapted for boring wood (whence the name); and a remarkable structure of the palatal and hyoidean bones and salivary glands. (See cuts under salivary and sauropaathous.) The tongue is capable, in most species, of being thrust far out of the mouth, and is lumbriciform. (See cut under sayittilingual.) The plumage as a rule is variegated in intricate patterns of coloration, and usually includes bright, rich, or striking tints. Insects constitute most of their food; their eggs are white, and are laid in holes they dig in trees; their voice is harsh and abrupt. They are of great service to man by destroying large family Picidæ, of which there are numersincitum. (See att under santifilingual). The planage as a rule is variegated in intractor patterns of coloration, and issually includes right, rich, or string tints. Insects constitution in the coloration, the planage is a rule is variegated in intracts patterns of the coloration and assually includes right, rich, or string tints, the coloration and another patterns of the coloration and another patterns of the coloration and another patterns of the coloration and of some time called Piens strickland; but distinct from strickland's woodpecker in having the upper parts of a nuiform light brown color and the spots of the under parts guttiform. Haryitt, Ibis, 1866, p. 115.—Audubon's woodpecker, the snall southern form of the hairy woodpecker (which see), named Pieus audubon's by Dr. James Trudeau in 1837, without reference to the prior homonym.—Ayres's woodpecker, Colaptes qurest of Andubon (1830), C. hybridus of Baird (1858), Pieus hybridus curatomexicanus of Sundeval (1866), names covering the remarkable flickers of western North America, especially of the upper Missouri and adjacent regions, which present every step of the intergradation between the yellow-shafted and the red-shafted flickers (C. auratus and C. mexicanus; the so-called hybrid woodpecker. The coloration is so unstable that it often varies on right and left sides of the same specimen. The case is unique, and its interpretation continues in question by ornithologists.—Baird's woodpecker, (a) The Cuban ivorybill, Campophilus beirdl, named by J. Cassin, in 1863, in compliment to Spencer Fillerton Baird (1823–1887). (b) The Californian woodpecker, Var. A, Brachypteruss erythronotus, of Ceylon. and reddish tints. Lutham, 1753.—Crimson-rumped
woodpecker, Mesopicus yestfan, the goertan or pic vert Africa, 9) to 10 inches long, much varied with olivaceous and reddish tints. Lethum, 1783.—Crimson-rumped woodpecker, Mesopicus goodna, the gootton or pic vert du S'n'iyal of early French writers, a West African species, sinches long, of a golden-olive color above, with searlet rump and upper tail-coverts, and otherwise much variegated.—Cuban woodpecker, Nesoceleus fernanding, and Cuban ficher, 114 to 12 inches long, above olive-black barred with yellow, and confined to Cuba.—Downy woodpecker, Picus

(Dendrocopus) pubescens, a small black and white species, 6 or 7 inches long, one of the commonest woodpeckers of eastern parts of North America, and among those popularly called sapsucker (which see). It is exactly like the hairy woodpecker, except in size, and an having the lateral tailfeathers barred with black and white, instead of being entirely white. There is no such difference between the two as the terms downy and hairy would seem to imply. This species corresponds in the United States to the lesser spotted woodpecker of England.—Gairdner's woodpecker, Picus pubescens gairdneri, the western subspecies of the downy woodpecker, having few if any white spots on the black wing-coverts, and in some localities the belly smoky-gray: dedicated by Audubon in 1839 to Dr. Meredith Gairdner, a Scotch naturalist.—Gila woodpecker, the saguaro or pitahaya woodpecker. See cut under pitahaya.—Gilded woodpecker. (a) An American flicker of the genus Colaptes, as the golden-winged woodpecker, C. aurotus. See cut under flicker? (b) Specifically, one of these, C. chrysoides, of Arizona, Lower California, and southward, which resembles the common flicker in the body, tail, and wings, but has the head as in the Mexican flicker.—Golden-shafted, golden-winged, gold-winged Woodpecker, and the control of the genus Colaptes, as the golden-winged woodpecker, C. auratus. See cut under Richer?. (b) Specifically, one of these,
C. chrysoides, of Arizona, Lower California, and southward,
which resembles the common flicker in the body, tail, and
wings, but has the head as in the Mexican flicker.
Golden-shafted, golden-winged, gold-winged woodpecker, the common flicker, Colaptes auratus.—Grayleaded woodpecker, Gerius canue, a popinjay of nearly
all Europe and much of Asia. Pennau. 1785, and more
fully gray-headed green woodpecker (Edwards, 1747).—

three-toed woodpecker, the bird figured under Tiga (which see).—Ladder-hacked three-toed woodpecker, Picoules americanus, marked by the characters indicated in the name, 8 to 9 inches long, common in northerly er, Procases americanus, marked by the characters mich ended in the name, 8 to 9 inches long, common in northerly parts of NorthAmerica.—Ladder-backed woodpeckers, those small black-and-white-spotted woodpeckers whose upper parts are regularly barred crosswise with black and white, as the Texan woodpecker and related forms. Coues.—Larger red-crested woodpecker, the pileated woodpecker. Catesby, 1731.—Largest white-billed woodpecker. Catesby, 1731.—Largest white-billed woodpecker. Catesby, 1731.—Largest white-billed woodpecker. Catesby, 1731.—Lesser black woodpecker (Latham, 1782), the homonym of two different species of South American woodpeckers. Melancryes rubrifroms and M. cruentatus.—Lesser spotted woodpecker, Picus (Dendrocopus) minor, ranging through nearly all Europe, much of Asia, and parts of Africa. It is one of the woodpeckers common in Great Britain, where it corresponds to the downy woodpecker of the United States. It is 6 inches long, of black and white color in intricate pattern, the male with a red hindhead.—Lewis's woodpecker, Asyndesmus torquatus of Cones, originally Picus loverer, Captain Meriwcher Lewis, United States army. It inhabits western North America, chiefly in mountainous parts of the United States, and is generically distinct from

woodpeckers in having the plumage of the under parts hair-like by reason of disconnection of the barbs of the feathers. It is 10 to 12 inches long, greenish-black with bronze luster, a patch of velvety crimson feathers on the face, the under parts and a coliar round the neck hoary-gray, heightened to rose or lake-red on the belly. Also called collared and bristle-bellied woodpecker. Lineated woodpecker, Ceophlæus or Dryocopus (formerly Picus) lineatus, of Central and South Americs, of rather large size (14 inches long), crested with crimson, and otherwise resembling the pileated woodpecker, to which it is nearly related.— Little brown woodpecker, to which it is nearly related.— Little brown woodpecker, to which it is nearly related.— Little brown woodpecker, to list in the peninsula, 43 inches long. Lathem, 1781.—Magellanic woodpecker, Ipocrantor magellanicus, s monotypic species of Chili and Patagonia, 15 inches long, mostly blueblack with searlet crested head.— Malaccan woodpecker, Chrysophlegma malaccensis, of the Malay countries, Sumatra, and Borneo. It is one of a group of about 8 Oriental species of this genus. Latham, 1782.—Manilla green woodpecker, the Cape woodpecker by a geographical blunder). Latham, 1782.—Maria's woodpecker, sung hairy woodpecker, named Picus martine by Andubon in 1839 sfter a Miss Maria Martin.—Masked woodpeckers, the genus Xenopicus. Coues, 1884.—Narrow-fronted woodpecker, Melanerpes formictorus angustifrons, a variety found in Lower California, having not the forehead but the white frontal stripe narrower than usual.—Nublan woodpecker, the leading species of a group of about 12 species composing the Ethiopian genus Campothera; C. nublea, of Abyssinia and south to equatorial Africa. Latham, 1782.—Nuchal woodpecker, a western variety of the sapsucker, Sphyropicus varius nuchalis, showing more red on the head, and thus an approach to S. ruber.—Nuttall's woodpecker, resu (Dendrecopus) nuttalli, the ladder-backed woodpecker, a western variety of the Sapsucker, Sphyropicus varius nucha originally described in 1760 by Brisson as pic at Cap at Banne Espérance, and the female the same year by the same as pic verd de Benyal, whence the Linnean (1766) Picus aurantius and Picus benyalensis. The same bird served also as the type of Malherbe's genus Brahmapicos, dedicated to the leading personage of the Hiodu Trimurti. rectal authors and retas beingheits. The Same Did served also as the type of Malherbe's genus Brahmapicos, dedicated to the leading personage of the Hiodu Trimurti.—Phillips's woodpecker, a young hairy woodpecker, so named as a distinct species in 1839, by Audubon, after Benjamin Phillips, F. R. S.—Pileated woodpecker, the black log-cock of North America, Hylotomus or Dryotomus or Phlwotomus or Ceophlous pileatus, originally Picus pileatus. See cut under pileated.—Pole-backed three-toed woodpecker, Picoides americanus dorsalis, having a long white stripe lengthwise down the middle of the black back, of the Rocky Mountain region of the United Statea.—Raffles's woodpecker, Gauropicoides rofflesi, a monotype inhabiting Tenasserim, the Malay peninaula, Sumatra, and Borneo, originally named Picus rafflesii by Vigors, in 1831, after Sir Stamford Raffles. The upper parts are mostly uniform golden-olive.—Rayed woodpecker, one of the zebra-woodpeckers, Picus or Centurus or Zebrapicus striatus, of Hayti and San Domingo. Latham, 1782.—Red-bellied woodpecker, Centurus carolinus, one of the zebra-woodpecker, Centurus, but having the whole head, neck, and breast carmine-red in both sexes.—Red-checked woodpecker (of Edwards, 1764, Celeus undatus, a crosted Amazonian species of a genus of 14 species peculiar to the Neotropical region.—Red-cockaded woodpecker, Melanerpes erythrocephalus: so named by Catesby in 1781. See cut under Melanerpes.—Red-shaft-ed woodpecker, the Mexican flicker, Colaptes mexicanus.—Red-throated woodpecker, formerly described as Melanerpes rubriyularis (Sclater).—St. Lucas woodpecker, leaded rebacked woodpecker, formerly described as Melanerpes rubriyularis (Sclater).—St. Lucas woodpecker, leaded er-backed woodpecker, formerly described as Melanerpes ed woodpecker, the Mexican flicker, Colaptes mexicanus.—Red-throated woodpecker, the adult male of the thyroid woodpecker, formerly described as Melanerpes rubrigularis (Sclater).—St. Lucas woodpecker, the ladder-backed woodpecker of Lower California: a local race called Picus scalaris leucasanus.—Sap-sucking woodpeckers, the trne sapsuckers of the genus Sphyropicus (which see, with cut).—Smallest spotted woodpecker, the downy woodpecker. Catesby, 1731.—Strickland's woodpecker, Picus (Dendrocopus) strickland; of southeastern Mexico, dedicated in 1845 by Malherbe to Hugh E. Strickland, principal author of the Stricklandian code of nomenclature in ornithology. It is 7½ inches long, has the back and rump barred with blackish-brown and whitish, the under parts white, fully streaked with black.—Superciliary woodpecker. See superciliary.—Texan woodpecker, the ladder-backed woodpecker of Texas to Arizona and southward to Yucatan, Picus (Dendrocopus) scalaris, 5% to 6% inches long, having the upper parts regularly barred crosswise with white and black. Also called Texas sopsucker.—Three-toed woodpecker, any species scalaris, 5, to 6, inches long, having the upper parts regularly barred crosswise with white and black. Also called Texas sapsacker. — Three-toed woodpecker, any species of several different genera of Picine, in which the first digit (inner hind toe) is lacking. This peculiarity recurs in genera otherwise very close to those in which the feet are normally yoke-toed, so that the species which exhibit it do not form a group by themselves. The three-toed genera are Picoides, Gauropicoides, Gecinulus, and Tiga (see cut under Tiga). The same peculiarity marks the genus Sasia among the Picunninx.—Thyroid woodpecker, Sphyropicus thyroideus, a remarkable sapsucker of western North America, the opposite sexes of which differ so much that they have been placed in separate genera, and repeatedly described as different species, called brownheated, red-throated, Williamson's, etc., woodpecker, Picus thyroideus (Cassin, 1851). Colaptes thyroideus, Picus natuliæ (Malherbe, 1854). Centurus natuliæ, Picus villiamson's (Newberry, 1857), Mclanerpes thyroideus, M. rubrigularis, etc. The length is 9 to 9 in ches, the extent 16 to 17; the adult male is glossy blue-black, with scarlet throat, an some other markings white: the female is only continuously black in a shield-shaped area on the breast, otherwise barred closely and regalarly with black and white or whity-brown, the head uniform hair-brown, the quills marked with white some to pairs. wise barred closely and regularly with black and white or whity-brown, the head uniform hair-brown, the quills mark-ed with white spots in rows of pairs. The sexual differ-ences begin with nestlings as soon as they are fledged, con-trary to one of the broadest rulles in ornith-logy — namely, that, when the adults of opposite sexes differ decidedly in

color, the young makes resemble the female, and acquire their distinctive markings at maturity only.—Tricolor was proposed to be considered genus gray rabbit of the United States, Lepus sylvationary as the red-headed. wood-pewee (wud'pē"wē), n. A tyrannuline, or little olivaceous flycatcher, of the genus Contopus, the species of which are numerous Contopus, the species of which are numerous in the warmer parts of both Americas. The common wood-pewee, C. virens, is the most abundant of its tribe in the woodlands of many parts of North America. It resembles the water-pewee, or pewit flycatcher (compare ents under Contopus and pewit), but is smaller (only 6 or 8) inchea long, and 10 or 11 in extent), with extremely small feet, and broad flat beak; the feet and upper mandible are black; the lower mandible is usually yellow; the eyes are brown; the plumage is olive-brown shove, below dingy-whilish tinged with yellow and shaded with the color of the back, especially across the breast and along the sides. The nest is flatly saddled on a horizontal bough, stuccoed with lichens; the eggs are four or flye in number, creamy-white, marked with reddish-brown and illac apots usually wreathed shout the larger end. The note is a long-drawn querdlous whistle of two or three sylables, imitated in the word pewee. The western woodpewee is C. v. richardson.

wood-sorrel (wud'sor"el), n. A plant of the genns Oxulis. The common wood-sorrel is O. Acetosella. This is a low stemless species, found in damp deep shade through the north temperate zone. Its peduncles bear single delicate flowers, the petals white with light-reddish veins. It has the old or local names alleluia, cuckoobread, stabwort, etc., and it is regarded by some as the original Irish shannock. The violet wood-sorrel, O. rio-lucca, is a similar somewhat smaller American plant with violet petals, growing in less shaded ground. (See cut under Oxalic.) O. corniculata, the yellow wood-sorrel having slender leafy branching stems which are creet or procumbent, with small yellow flowers, grows nearly everywhere. The leaves in this genus contain oxalic acid, and have a sourish taste. Several Mexican and South American species yield edible tuberous roots. (See oca and arraeacha.) Several exotic species are cultivated in greenhouses, as O. purpurata, var. Boucie, with abundant flowers of a deep rose-color, O. flowa with yellow flowers, and O. rersicolor with flowers calibiliting a pluk exterior when closed, white within, opening only in sunshine: these are all from the Cape of Good flope.

Connection with Gr. εριον, wool, είρος, wool, οίκος, woolly, shaggy, thick, etc., is doubtful.] 1. The fine, soft, curly hair which forms the fleece or fleecy coat of the sheep and some other animals, as the goat and alpaca, in fineness approaching fur. The wool or fleece of the sheep furnishes the most important material for clothing in all cold and temperate climates. The felting property from which wool derives its chief value, and which is its special distinction from hair, depends in part upon the kinks in the shaft or fiber, but mainly upon the scales with which the surface is imbricated. These scales are minute, from about 2,000 to nearly 4,000 to the inch, and whorled about the stem in verticils; the stem itself is extremely slender, being less than one thousandth of an inch in diameter. Wool is kept soft and pliable by the wool-oil, commonly called yolk. In different animals wool shades by imperceptible degrees is to hair; and that of the sheep simply represents an extreme case of the most desirable qualities, namely, flueness, kinkiness, and scallness of the fiber, together with its length, strength, and luster, and the copiousness of the fleece, which consists entirely of wool, without thair; in all of which particulars the wool of the different breeds of sheep varies to a degree. (Coropare def. 2) Wool when shorn is divided into two classes, short wood, or carding-wool, seldom exceeding a length of 3 or 4 inches, and long wood, or combing-wool, varying in length from 4 to 8 Inches, each class being abublivited into a varlety of sorts, according to the fineness and soundness of the staple. The finest wools are of short staple, and the coarser wools usually of long staple. Wools which unite a high degree of theness and softness with considerable length of staple bear a high price. English-bred sheep produce a good, strong combing-wool, that of the Scotch breeds being somewhat harsher and coarser. The floest carding-wools were formerly exclusively obtained from Spain, the native country of the merino sheep, and at a later period extensively from Germany, where that breed had been successfully introduced and cultivated. Immense flocks of merinos are now reared in Australia, North and South America, and South Africa. fineness approaching fur. 10. In mech.: (a) The product of a force by the component displacement of its point of application in the direction of the force; or, if this is variable, the integral of all successive this is variable, the integral of all successive infinitesimal such products for any motion of the point of application. The work is thus the same whatever be the velocity of the motion or the mass moved, so long as the force and the displacement are the same. Thus, if an electrified body is moved by an electrical force along a horizontal surface, the work is the same whatever the mass of the body moved. But if the same electrical force moves the body for the same distance but upward against gravity, less work on the whole is done, since the force of gravity undoes a part of the work which the electrical force performs. Negative work, or work undone, is also called resistant work, in contradistinction to motor work. The total work performed upon a particle is equivalent to the kinetic energy it loses. If a force is resisted by friction, the same amount of work is done as if it were not resisted; for, though the resultant force upon the mass moved is less by the amount of the friction, so that less work is done upon the mass as a whole, yet heat is produced, and the particles receive displacements in the direction of the action of friction, the work done in the displacement of sensible masses, as opposed to work done in the displacement of sensible masses, as opposed to work done in the displacement of sensible masses, as opposed to work done in the displacement of sensible masses, as opposed to work done in the displacement of the confined gases is reduced by a proportional amount, and heat is said to be transformed into mechanical work. We have thus arrived at the immensely important conclusion that no heat-engine can convert into vork a greater infinitesimal such products for any motion of

We have thus arrived at the immensely important conclusion that no heat-engine can convert into work a greater fraction of the heat which it receives than is expressed by the excess of the temperature of reception above that of rejection divided by the absolute temperature of reception.

11. In physics and chem., the production of any physical or chemical change. For example, if a body is heated, the effects are said to be the internal work of increasing the kinetic molecular energy—that is, increase of temperature—of change of volume, cohesive elasticity and the external work involved in its expansion, and hence overcoming the surrounding atmospheric pressure. An example of work in the chemical sense is that done when a chemical compound is decomposed, as by an electrical current in electrolysis. See further under energy, 7.

Work is the generic term for exertion of body or mind; it stands also for the product of such exertion, while the others do not. Labor is heavier; the word may be qualified by strong adjectives: as, confinement at hard labor. We may speak of light work, but not of light labor. Toil is still heavier, necessarily involving weariness, as labor does not. Drudgery is heavy, monotonous labor of a servile sort.

workable (wer'ka-bl), a. [\langle work + -able.]

1. That can be worked, or that is worth work-1. That can be worked, or that is worth working: as, a workable mine; workable eoal. The term workable, as applied to coal, has two meanings: one refers to the maximum limit of depth, the other to the minimum limit of thickness of the bed or beds. In the Report of the English Royal Commission appointed in 1866, the limit of workable depth was taken as 4,000 feet, that of thickness at 1 foot. But no coal has yet been worked to so great a depth as that, and it has only very rarely happened that a seam of less than 2 feet in thickness has been actually mined.

Clay . . . soft and workable. Ascham, Toxophilus, ii. I apprehend that the Commissioners [the English of 1866] placed the limit of thickness as low as 12 inches because their inquiries were not in that connection directed to the question what amount of coal would ultimately be found commercially workable; It was the simple physical limits which they were chiefly regarding.

Worldly, Secular, Temporal, Enrithly, Earthy, Unspiritual, Carnal. Worldly means of the world, in fact or in spirit, in distinction from that which is above the world; as applying to mind, it indicates a pleasure in the things that belong to the external life and a disregard of spiritual even intellectual pleasures; it is opposed to spiritual, expressing positively what unspiritual expresses negatively.

Secular is opposed to sacred or to ecclesiastical; as, there are six secular days in the week; the secular arm. Secular and temporal are rarely used in a bad sense. Temporal is opposed to spiritual or eternal; as, lords temporal; merely temporal concerns. Earthly has, like wordly, the sense of mundane, but in the sense of mispirituality it suggests more of grossness or groveling, a thought which is carried still further by earthy, although earthy is not often used in that sense. Carnal suggests that which belongs to the gratification of the animal nature; it ranges from the merely unspiritual to the sensual. See sensual and temporal. worldly (werld'li), adv. 5. That which is cast ashore by the sea; shipwreeked property, whether a part of the ship or of the eargo; wreekage; in old Eng. common law, derelict of the sea cast upon land within the body of a country, and not in the possession of the owner or his agents. Wreek, or more fully wreek of the sea, was at common law applied only to wrecked property cast by the sea upon the land; and this included things grounded—that is, not floating at the time of seizure, although in a position where the tide would float them again. All such property was originally the perquisite of the crown, or of its tenant the lord of the manor; but in course of time an exception was made of wrecks from which any living thing escaped to land, in which case a presumption that an owner would appear arose and the property was preserved for a year and aday, after which if no claim was established the right of the crown was recognized. Wreeked matter floating was within the jurisdiction not of the common-law courts, but of admiralty, and known as derelict, or derelict of the sea. This too was a perquisite of the crown, claimed under the name of a droit of admiralty. Such matter was classed as futsam, jetsum, and lagan or ligan (which see). In the United States the right to derelict for which the owner does not appear is in the Federal government; the right to wreek for which he does not appear is in the State to whose coast it comes, subject usually in either case to the right of the rescuer of it to a compensation known as salvage.

wren (ren), n. [Also dial. wran; < ME. wrenne, wranne, a wren. < AS. wrenna, wrænna, a wren.] A very small migratory and insectivorous sing-ing-bird of Great Britain and other European countries, with a slender bill and extremely short tail, and of dark reddish-brown coloration varied with black, inhabiting shrubbery, and belonging to the family Trogladytidæ; hence, any member of this family, and, with a quali-fying term, one of various other small birds of different families, as certain warblers, kinglets, fying term, one of various other small birds of different families, as certain warblors, kinglets, etc. See the phrases below. Wren originally specified the bird technically known as Sylvia troglodyles, Troglodyles parvalus, T. vulgaris, T. vuropeus, Anothira troglodyles, Accommunis, etc., the only member of its genus and family found in Europe. It is only about four inches long, very active and sprightly, with a pleasing song at times, and a characteristic habit of carrying the short tall cocked up. This little bird figures extensively in English folklore, and has a host of local, provinctal, or familiar names with creu expressed or implied, as bobby, cutty, kitty, jenny, salty, scuty, tiddy, tidley, tity, also our hady of Heaven's hen, etc. This wren is a northerly type, and one of several species of the restricted genus Troglodyles (or Anorthora), as T. funigatus of Japan, T. alascensis of Alaska, and the well-known winter wren of North America, T. hiemalis, which is so near the English wren as to be by some naturalists regarded as only a variety. (See cut under Troglodyles.) In the United States the commonest wren, and the one which plays there the part taken by the English wren in Europe, is the house-wren, T. action or T. domesticus, which abounds in most parts of North America, from the Atlantic to the Pacific, runs into several geographical races, and is represented in Mexico and warmer parts of America by several other varieties or congeneric apecies. The common house-wren in settled districts attaches itself closely to man, and nests by preference in nooks and erannies of outhouses, though it is more retired and wood-loving in other regions. It trills a hearty and voluble song, and lays numerous (from 6 to 10) pinkish-

white eggs very heavily spotted with brown, in the large mass of rubbish which it carries into its hole for a nest. This wren is migratory, and in many purts of the United States its presence is complementary to that of the winter wren. Certain wrens of North America, of the genus Cristothorus (and its section Teluatotyles), inhabit marshes and low wet shrubbery, and are known as marsh-wrens, and low eye shrubbery, and are known as marsh-wrens, and thee generic names, marsh-wren, and tule-veren.) Various others, chiefly of southern regions of the l'nited States, and thence southward, as the great Carolina and Bewick's, are of the genus Thryothorus (which see, with cut). Others are the rock-wrens, canon-wrens, and carus-wrens, of the genera Salphottes, Catherpes, and Campulorhynchus. (See the compound and technical names, with cuts.) All these belong to essentially Nectropical types, which have but few outlying forms in the United States, though richly represented by very numerons species of various genera in the warmer parts of America (as those above named. Thryophitus, Uropsila, Henicorhina, Cyphorhins, and Microcerculus). The wens above noted are all properly so called (Troglodytidæ): with the exceptions named, they are all American. The qualified application of wren to various small birds of both hemispheres. Including some of other families than Troglodytide, is given in the plurases following.

[Verbal n. of wrestle, r.] The act of trying to threw another person to the ground; the act of two persons contending which shall throw the other to the ground and overpower bim. Wrestling, as a game subject to special rules, is of great antiquity. It was held in high esteem by the Greeks, and their youth were taught it by special masters as part of the public education. In its highest and simplest form it was the fifth of the five tests of the pentathion. In this contest the wrestlers wrestled standing and naked, any hold being allowed, and three falls constituting victory. Wrestling, in combination with boxing, formed the ardnons and dangerous contest known as the pancrativan—a contest much more resembling a fight to a finish than an athletic contest. A third form of wrestling, which does not seem to have come down to modern times, consisted in interlocking the fingers, pushing the palms of the hands together, and twisting the joints and wrists, without the assistance of any other member or of any hold of the body. The highest and purest form of Greek wrestling does not appear to have been transplanted to Rome, although the more contentions and cruel pancratium—a sport more nearly allied to the Roman gladiatorial spirit—was introduced there by Caligula, and became very popular.

wrist (rist), n. [Early mod. E. also wreast, wrest; \langle ME. wrist, wriste, also wirste, wyrste, \langle AS. wrist (usually in comp. hand-wrist) = OFries. wrist, riust, wirst, werst (hond-wriust, wirst) wrist (rist) 'hand-wrist,' fot-wriust, 'foot-wrist,' instep) = LG. wrist = MHG. rist, riste, G. rist (G. dial. frist), hand- or foot-joint; cf. G. wider-rist, withers of a horse (see withers), = Icel. rist = Sw. Dan. vrist, instep; with formative -t (-tht > -st), < writhen, twist, writhe: see writhe, and cf. wrest.] 1. That part of the fore limb or of. wrest.] 1. That part of the fore limb or arm which comes between the forearm and the hand, and by which the latter is joined or jointed to the former; the wrist-joint; technically, the carpus, or the carpal articulation. The wrist is the first segment of the manua, and its skeleton consists in man of seven carpal bones, together with a sesamoid bone (the pisiform) on the ulnar side, these eight bones being disposed in two rows of fore each, proximal and distal. The whole set of bones, their articulations with one another and with the radius, ulna, and the several metacarpals, together with the ligaments and other associated soft parts, are included in the term wrist. The motions of the wrist as a whole upon the forearm include all the movements of flexion, extension, abduction, and circumduction, together with the ulnar; but the motion of the individual carpal bones upon one another is slight, and that between the distal carpals and the metacarpals is still less. In most other animals than man, the movements of the wrist are more restricted. The term is extended to the corresponding joint of the fore limb of the manuals, birds, and reptiles. Thus the so-called knee of the horse's fore leg is anatomically the carpus or wrist. See carpus, and cuts under hand, pisiform, and scapholunar.

Ship's writer. See ship.—The writer, the author of this writing; the writer hereof: used elliptically by a writer with reference to thimself, to avoid saying I.—Writer of the tallies. See tally1, 1.—Writers' cramp, an occupation-neurosis occurring in those who write much, especially in a contracted hand. It affects at first usually only those muscles which are directly concerned in the production of writing movements, but, if the act is persisted in, the neighboring muscles may also share in the disturbance. The affection may manifest itself under one of four forms or a combination of them—namely, paralytic, in which weakness in the fingers or even absolute inability to hold the pen is experienced; spastic, in which the attempt to write excites clonic or tonic contractions of the fingers; tremulous, in which the hand shakes so while writing that the letters formed are indistinguishable; and sensory, in which the effort to write causes severe pain, tingling, or other abnormal sensations in the hand and at times in the forcarm also. The symptoms vary greatly in different individuals, usually, however, increasing in severity as long as the attempt to use a pen is persisted in. The use of steel pens and metal penholders is supposed to increase the liability to the affection. Also called seriencers' cramp or palsy, writers' palsy or paralysis, and graphospasm.—Writers to the signet. See signet. 1.

Xanthorrhiza (zan-thō-rī/zā), n. [NL. (Marshall, 1789), ⟨Gr. ξανθός, yellow, + ρίζα, root.]

A genus of polypetalous plants, of the order Ranunculaeeæ, tribe Helleboreæ, and subtribe Cimicifugeæ. It is characterized by regular racemose flowers with five or ten stamens, and five or ten carpels which become follicles in fruit. The only species, X. apiifolia, is a native of the United States, growing on shaded mountain-banks from Pennsylvania and western New York to Kentucky and southward. It is a dwarf shrub with its stem yellowish within, bearing pinnately decompound leaves and pendulons compound racemes of brownish-purple flowers with petaloid sepals and small glandlike petals. Its yellow rootstock secures it the name of shrub-yellowroot (which see); this and the bark are intensely bitter, and afford a simple tonic of minor importance.

It is characterized by corlaceous sagitate or pedate leaves, by two- or three-celled ovaries acparate below but dilated and united above, forming betries in fruit which are included within the spathe-tube, and by anatropous ovules with an inferior micropyle, mostly attached to the partitions. There are about 20 apecies, natives of tropical America. They are herbs with a milky juice, producing a tuberous rootstock or thick elongated caudex. They bear long thick petiolate leaves; the flowerstalks are usually short, often numerons, and produce a spathe with an obloog or ovoid convolute tube which bears a boat-shaped lamins and enlarges in fruit. The spadix is shorter and included; the fertile and densely flowered lower part is separated by a constriction from the clongated male section. X. atrovirens is known in the West Indies as kale, and X. peregrinum (perhaps the same as the last) as taya; for X. sagittifolium, see tannier.

It is characterized by alternate pinnate leaves, by polygamons flowers with from three to five imbricate or induplicate petals and three to five stamens, and by a fruit of one to five some what globose and commonly two-valved carpels. There are about 110 species, widely distributed through tropical and warm regions; nearly 50 occur in Brazil, many others in the West Iodies, Mexico, and Central America, and 5 in the United States. They are trees or alrubs, sometimes armed with straight or recurved prickles. The leaves are commonly odd-pinnate, rarely reduced to one to three leaflets; the leaflets are entire or crenate, oblique, and pellucid-dotted. The flowers are small, usually white or greenish, commonly in crowded axillary and terminal panicles. The fruit is usually aromatic and pungent, with a glandular-dotted pericarp. The bark, especially that of the roots, is powerfully stimulant and tonic, and often used for rheumatism, to excite salivation, and as a cure for toothache; it contains a bitter principle (berberine) and a yellow coloriog matter; in the West Indies it is esteemed an antiayphilitic. Three species in the United States are small trees, of which \(X\). Critoroum (\(X\). of sparoid fishes, typical of the Xenichthyinæ, as X. californiensis. This queer lish is of a silvery color with continuous dusky stripes along the several rows of scales on the upper part of the body, and is found from San Diego southward.

Xenicidæ (zē-nis'i-dē), n. pl. [NL., \Xenicus + -idæ.] A family of non-oscine (elamatorial or mesomyodian) passerine birds, typified by the genus Xenicus. and confined to New Zealand. Also called Acanthisittidæ. They were formerly supposed to be creepers, warblers, nuthatches, or wrens, and classed accordingly, but are now placed in the vicinity of the Old World ant-thrushes and related forms (Pittidæ, etc.). There is only one intrinsic syringomyon; the sternum is single-notched on each side behind; the nasal bones are holorhinal, the maxillopalatines are slender, and the vomer is broad, with anterior emargination; the tarsi are not laminiplantar; the primaries are ten, with the first about as long as the second, and the rectrices are ten. Acanthisitta chloris (the citrine warbler of Latham, 1783) is a short-tailed creeper, quite like a nuthatch in appearance and habits; the species of Xenicus resemble wrens. See Xenicus.

See Xenicus.

Xenicus (zen'i-kus), n. [NL. (G. R. Gray, 1855), ⟨ Gr. ξενικός, of a stranger, ⟨ ξένος, a stranger.] The name-giving genus of Xenicidæ. It contains two species. X. longipes is the long-legged warbler of Latham (1783), remarkably like a wren in appearance and habits; the other species is X. gilviventris of Julius Haast.

Menisma (zē-nis'mā), n. [NL. (Jordan, 1876). ζ Gr. ξένυσμα, amazement, ζ ξενίζειν, snrprise, make strange, ζ ξένος, strange.] A genus of eyprinodonts, or a subgenus of Fundulus, whose dorsal fin is high and begins opposite or slightly behind the anal. Two species inhabit tributaries of the Lower Mississippi. See cut under studfish

studism.

xenium (zē'ni-um), n.; pl. xenia (-ä). [NL., ζ
Gr. ξένιον, usnally in pl. ξένια, a gift to a guest
from his host, neut. of ξένιος, of a guest, ζ ξένιος,
a guest, stranger.] In classical antiq., a present given to a guest or stranger, or to a foreign am-

bassador.

Xenocichla (zen-ö-sik'lä), n. [NL. (Hartlaub, 1857), ζ Gr. ξένος, strange, + κίχλη, a thrush.]

An extensive genus of Ethiopian birds, conventionally referred to the Timeliidæ, and also called Blcda, Pyrrhurus, Bæopogon, and Trichites. Fitten species are described; they differ much from one another. Some have often been put in such genera as Pycnonotus, Criniger, or Trichophorus, and all are called by the name bubbul, in common with other birds more or less nearly related. X. icteria is the yellow-browed bulbul; X. flavicoliis, the yellow-throated; X. tephrokema, the ashy-throated; X. senina, the red-billed; X. supdactyla (the type of the genus, from Senegambia to Gaboon), the chestnuttailed; X. scandens, the pale; X. albigularis, Ussher's; X. indicator, the honey-guide; X. Leucopleura, the whitebellied; X. notata, the yellow-marked; X. canicapilla, the gray-headed.

Xenocratean (zē-nok-rā-tē'an), a. [\(\sum \text{Xenocratea}\) (see def.).] Pertaining to the doctrine of Xenocratean (ze-nok-ra-te'an), a. [Annocrates (see def.).] Pertaining to the doctrine of Xenocrates, a Greek philosopher, who was the head of the Academy, the second after Plato. He is known to have been a voluminons and methodical writer, adhering pretty closely to his master's teachings, but inclined to the doctrines of the Pythagoreans. He held that the ideas were numbers, and that all numbers were produced from 1 and 2.

Xenocratic (zen-ō-krat'ik), a. Same as Xenocratics

Xenocrepis (zen-ō-krē'pis), n. [NL. (Förster, 1856), Gr. $\xi \xi \nu o c$, strange, $+ \kappa \rho \eta \pi i c$, a half-boot.] A genns of hymenopterous parasites, of the chaleid subfamily *Pteromalinie*, having thirteen-jointed antennæ with two ring-joints, the stigmal club small, and the marginal vein thick-ened. The species are European.

Xenodacnis (zen-5-lak'nis), n. [NL. (Cabanis, 1873), (Gr. & Fivoc, strange, + NL. Dacuis, q. v.] A genus of guitguits or Carebida. The type is X. pucina of Peru, 4) inches long, the male of a nearly uni-

form dull purplish-blue, the wings and tail blackish edged with blue. The form is peculiar among the guitguits, the bill having a parine shape, though no nasal briatles.

xenoderm (zen'ō-derm), n. [<NL. Xenoderma.]

A wart-snake of the subfamily Xenodermating.

Xenoderma (zen-ō-der'mā), n. [NL. (Reinhardt), ζ Gr. ξένος, strange, + δέρμα, skin.]
The typical genus of Xenodermatinæ, with granular scales, simple urosteges, and no frontal nor parietal plates. The genus has also been

placed in Nothopsidæ. Also Xenodermus.

Xenodermatinæ (zen-ō-der-ma-tī'nē), n. pl.
[NL., < Xenoderma(t-) + -inæ.] A subfamily of Acrochordidæ or wart-snakes, represented by

the genus Xenoderma. Also Xenodermina, xenodermine (zen-ō-der'min), a. [< Xenoderma + -ine¹.] Of or pertaining to the Xenodermatinæ.

Xenodermus (zen-ō-der'mus), n. [NL.] Same as Xenoderma.

xenodocheum, xenodochium (zen "ō-dō-kō'um, -ki'um), n.; pl. xenodoehea, xenodochia (-ij). [LL. xenodochium, \langle Gr. $\xi \varepsilon vo\delta o \chi \varepsilon iov$, a place for strangers to lodge in, a hotel, \langle $\xi \varepsilon vo \zeta$, a stranger, + δοχείον, a receptaele, ζ δέχεσθαι, receive.] 1. In classical antiq., a building for the reception of strangers.—2. In modern Greek lands, a hotel; an inn; also, a guest-house in a monastery.

xenodochy (zē-nod'ō-ki), n. [\langle Gr. ξ evo δ o χ ia, the entertainment of a stranger, \langle ξ evo ξ , a stranger, + δ o χ η , a receiving, \langle δ exe ξ evo ξ a, receive.] 1. Reception of strangers; hospitality.—2. Same

as xenodocheum.

xenogamy (zē-nog'a-mi), n. [ζ Gr. ξένος, strange, + γάμος, marriage.] In bot., cross-fer-tilization—that is, the impregnation or fecundation of the ovules of a flower with pollen from another flower of the same species, either on the same or (usually) on a different plant.

the same or (usually) on a different plant. **xenogenesis** (zen- $\bar{0}$ -jen'e-sis), n. [NL., \langle Gr. $\xi \ell \nu \rho c$, stranger, + $\gamma \ell \nu \nu \epsilon \rho c$, birth.] The generation of offspring which pass through an entirely different life-cycle from that of the parents, and never exhibit the characters of the latter: a mode of biogenesis supposed by Milne-Edwards to occur, but not proved to have any existence in fact.

The term Heterogenesis... has unfortunately been used in a different sense (than that of the offspring being altogether and permanently unlike the parent), and M. Milne-Edwards has therefore substituted for it Xenogen-Milne-Edwards has therefore substituted for it A obega-esis, which means the generation of something foreign. Huxley, Lay Sermons, p. 353.

xenogenetic (zen[#]ō-jē-net'ik), a. [< xenogenesis (-et-) + -ic.] Of the nature of or pertaining to xenogenesis.

I have dwelt upon the analogy of pathological modifi-cation, which is in favour of the *xenogenetic* origin of mi-crozymes. *Huxley*, Lay Sermons (ed. 1871), p. 370.

xenogenic (zen-ō-jen'ik), a. [< xenogen-y + -ic.] Same as xenogenetic.

xenomenia (zen-ō-mē'ni-ä), n. [NL., ζ Gr. ξένος, strange, + μηνιαία, menses.] A loss of hlood occurring at the time of the menstrual flow elsewhere than from the uterus, and taking the place of the regular flow; vicarious menstruation. Compare $stigma^1$, 4.

Xenomi $(z\bar{e}$ -no'mi), n. pl. [NL., \langle Gr. $\xi \epsilon vo_{\zeta}$, strange, + $\dot{\omega}_{\mu o \zeta}$, shoulder.] A suborder of fishes, resembling the Haplomi, but distinguished by peculiarities of the pectoral arch (whence the name). It consists of the family Dalliidæ alone. See ent under Dallia.

xenomorphic (zen-ō-môr'fik), α. [ζ Gr. ξένος, strange, + μορφή, form.] In lithol., noting the mineral constituents of a rock when they are bounded by planes not formed as the result of their own molecular structure, but the result of their contact with other minerals also forming constituents of the same rock, which having erystallized first have impressed their form on those adjacent to them: the counterpart of

idiomorphie. Also called allotriomorphie. **xenomous** (zē-nō'mus), a. [< NL. Xenomi.]

 I. a. Having the characters of or pertaining to the Xenopterygii.
 II. n. A fish of this suborder.
 Xenopterygii (zē-nop-te-rij'i-i), n. pt. [⟨ Gr. ξένος, strange, + πτέρυξ, wing (fin).] A suborder of teleocephalous fishes, represented by the family Gobiesocide, and characterized by the development of a complicated suctorial organ in the pectoral region. The xenopterygians had usually been placed with the lump-fishes and smalfishes, in consequence of their common possession of a sucking-disk, which, however, is formed differently in the present suborder, being chiefly developed from the skin of the breast, in connection with the ventral fins. They are mostly fishes of oblong or lengthened conform shape, with scaleless skin and spheless fins, one posterior dorsal fin, more or less nearly opposite the anal, and the sucker either entire or divided. They are small fishes, most common lu tropical and warm temperate seas between tidemarks, adherent to rocks. There are fo genera and 25 or 30 speedes, as Gobiesox reticulatus, abundant in tide-pools on the Pacific coast of the United States.

Xenopus (zen 'ō-pus), n. [NL. (Wagler, about 1830), ⟨Gr. ξένος, strange, + ποίς (ποδ-) = E. foot.] The typical genus of Λenopodiciae. There are several species, all of tropical Africa, as X. kævis. They are called clared toads.

Xenorhina (zen -ō-rī'nā), n. [NL. (Peters, the development of a complicated suctorial or-

Xenorhina (zen-ō-rī'nā), u. [NL. (Peters, 1863), < Gr. ξένος, strange, + μίς (μν-), nose, snout.] A genus of batrachians, peculiar to New Guinea, typical of the family Xenorhinidæ. The species is X. argrephala.

Xenorhina (zen-ō-rīn'i-dē), u. μl. [NL., < Venorhina + μla] A pamily of Dangara har

Xenorhina + -idæ.] A family of Papuan batrachians, represented by the genus Xenorhina. Xenorhipis (zen-ō-ri'pis), n. [NL. (Le Conte, 1866), ζ (tr. ξένος, strange. + μπίς, also μίψ, wickerwork.] A genus of bmprestid beetles,

containing the single species X. brendeli, from Illiuois, remarkable in that the male antennæ are flabellate, a unique structure in the family Buprestidæ. Xenorhynchus (zen-ē-ring'kus), n.

(Bonaparte, 1855), ⟨Gr. ξένος, strange, + ρύγχος, beak.] A genus of storks or Cicontinæ, representing the Indian and Australian type of jabirus. X. australis is the black-necked stork

(which see, under stork). **Xenos** ($z\bar{e}$ 'nos), n. [NL. (Rossi, 1792), \langle Gr. $\bar{\xi}\ell$ - vo_{ζ} , strange.] A genus of parasitic coleopters, of the family Stylopidx, having four-jointed anef the family Stylopidæ, having four-jointed antenme and four-jointed tarsi. The species are found in middle and southern Europe and in North and South America. They are among the most remarkable of insects, and the genus is historically notable as containing the earliest known attepsipters. Also, and preferably, Xenus.

Xenosauridæ (zen-ō-sâ'ri-dē). n. pl. [Nl., < Xenosaurus + -idæ.] A family of American eriglossate lacertillans, related to the Iyuanidæ,

based on the genus Xenosaurus.

Xenosaurus (2en- $\tilde{\phi}$ -sa'rus), n. [NL. (Peters, 1861), ζ Gr. $\xi \dot{\epsilon} v \sigma \zeta$, strange, $+ \sigma a \bar{\nu} \rho \sigma \zeta$, a lizard.] The typical genus of $Xenosaurid\mathscr{R}$, based on X. grandis, a Mexican lizard about 10 inches long

xenotime (zen'ō-tīm), u. [⟨ Gr. ξενότιμος, favoring strangers, $\langle \xi i v o \xi, \text{strange}, + \tau \iota \mu \dot{\eta}, \text{henor.} \rangle$ A native phosphate of yttrium, having a yellowish-brown color, and crystallizing in squares, ectahedrons, and prisms. It resembles zircon in form, but is inferior in hardness.

Xenotis (zē-nō'tis), n. [NL. (Jordan, 1877), also Xenotes, ζ Gr. ξένος, strange, + οὐς (ἀτ-), ear.] A genus of centrarchoid fishes, very near in which it is sometimes merged Lepomis, in which it is sometimes merged, but having very short, weak, and flexible gill-rakers, and no palatine teeth. species are X. megatotis, X. marginatus, and X. bombifrons, of the United States, the first-named known as the long-eared sungish. This is 6 inches long, highly colored, and abounds in many parts of the United States.

Xenurine (zē-nū'rin), n. and u. [< Xenurus + -incl.] I. n. An armadillo of the genus Xenurus; a kabassou. In these forms of Dasypodias the buckler is more zoniferous than in the true dasypodines, and the tail is nearly naked; the feet are also somewhat peculiar in the proportions of the metacarpals and phalanges.

II. a. Of or pertaining to the genus Xenurus. Xenurus (κο-nū'rus), n. [NL., ζ Gr. ξένος, strange, + οὐρά, tail.] 1†. In ornith., same as Alectrurus. Boie, 1826.—2. In mammal., a genus of armadillos, named by Wagler in 1830; the xenurines or kabassous. There are 2 species,

X. unicinetus and X. hispidus, which inhabit tropical America, and burrow with great ease underground.

Xenus (zē'nus), n. [NL.: see Xenos.] 1. lu entom., same as Xenos.—2. In ornith., same as Terekia (where see cut). J. J. Kaup, 1829.

Xeocephus (zē-os'ē-fus), n. [NL. (Bonaparte, 1834), and Xeocephalus (G. R. Gray, 1869), and [NL. (B. Show, 1870)].

Zeocrphus (R. B. Sharpe, 1879); formation uncertain.] A genus of Muscicapidæ, confined to the Philippines. X, rufus of Luzon is 7 linches long, and mostly of a chnamon color. X. cinuamomeus of Basilan is similar, with a white belly. X. cinuamomeus of mostly of a grayish cobalt-blue, 8} inches long, and found in Palawan.

xerafin (zer'a-fin), n. [Also xeraphine, xerapheen, zeraphin, also, as Pg., xerafim; & Pg. xerajme, zerapini, also, as rg., zerapin; Yg. zera-fim, xarafim, < Ar. askrafī (ef. skarāfī, noble), applied prop. to the gold dinar, but also to the gold mohur; < skarīf, noble: see skerīf.] An Indo-Portuguese silver coin formerly current in Goa. About 1835 it was worth 75 United States cents.

States cents.

**xeransis* (zē-ran'sis), n. [NL., < Gr. \$\(\text{Spavov}\), a drying up, parching, < \$\(\text{spaine}\); quevev, dry up: see xerasia.] In pathol., siccation; a drying up.

Xeranthemum (zē-ran'thē-mum), n. [NL.]

Xeranthemum (zē-ran'thē-mum), n. [NL. (Tournefort, 1700), so called from the scarious involucre; ζ(Gr. ξηρός, dry, + ἀνθ μων, flower.] A genus of composite plants, of the tribe Cynaroideæ and subtribe Carlineæ. It is characterized by

long-stalked solitary flower-heads with the outer flowers small, two-lipped, and neutral, the liner ones bisexual and slightly five-cleft, and by free filaments and chaffy aristate pappus. There are 4 or 5 species, natives of the Mediterranean region. They are hoary erect branching annuals, without spines, bearing alternate leaves which are narrow and entire. The scarious inner bracks of the showy flower-heads are rose-colored or whitish; from their permanence V agrange the next frequently cultivated. permanence, X. annuam, the most frequently cultivated specles, is known as annual everlasting or immortelle. **xerantic** ($z\bar{e}$ -ran'tik), a. larly adapted to dry, especially to hot and dry climates, as by possessing coriaceous leaves, succulent stems, etc.; specifically, belonging to the group of xerophils. See xerophil. xerophthalmia (xē-rof-thal'mi-ä), n. [NL., < LL. xerophthalmia, < Gr. ξηροφθανμά, dryness of the cyes, < ξηρός, dry. + ὁφθανμός, eye.] A dry form of conjunctivitis, resulting in a thickening and skin-like condition of the conjunctiva. Also xeroma, and xerosis of the conjunctiva.

mg and skin-like condition of the conjunctiva. Also xeroma, and xerosis of the conjunctiva.

Xerophyllum (zē-rō-il'um), n. [NL. (Richard, 1803), so called from the harsh dry leaves; ⟨Gr. ξηρός, dry, + φίλλον, leaf.] I. A genus of liliaceous plants, of the tribe Nartheeiæ. It is characterized by crowded linear radical leaves, towers with three styles, and a loculleidal capsule. The 3 species are natives of the United States, and are known as turkeybæard. They are perennials, with a short thick woody rhizome, tall erect unbranched stem, and a great number of harsh rigid elongated leaves, usually forming a conspicuous basal tuft, and also numerous along the stem, but much smaller and thinner, finally diminished into bristles. The flowers are white and very showy, forming a long terminal raceme which is at first densely pyramidal or oblong and becomes afterward greatly elongated. X. setifolium, the eastern species, is a native of pine-barrens from New Jersey to Georgia; the western, X. Douglasii, with a smaller raceme, occurs from the Columbia river to Montana; the raceme of X. tenax, of California, is fragrant and dense, becoming over a foot in length.

2. [l. c.] A plant of this genus.

Xerosis (Zē-rō'sis), n. [NL, ⟨Gr. ξήρωσις, a drying up, ⟨ξηρός, dry: see xerusia.] Same as xerunsis.— Xerosis of the conjunctiva.

ransis.—Xerosis of the conjunctiva. Same as xerophthalmia.

Xestobium (zes-tō'bi-um), n. [NL. (Motschulsky, 1845), ⟨ Gr. ξεστός, smooth, dry, + βιοῦν, live.] A genus of bark-boring beetles, of the family Ptinidæ, having the prosternum very short and the tarsi broad. Three species are described from Europe, and three from North America. X. affine breeds in dead maple-stumps in the United States.

Ximenia (zī-mē'ni-ā), n. [NL. (Plumier, 1703), named after Francisco Ximenes, a Spanish naturalist, who wrote in 1615 on medicinal plants.] A genus of polypetalous plants, of the order Ola-A genus of polypetalous plants, of the order conciner and tribe Olacce. It is characterized by flowers with the calyx persistent unchanged, the petals inwardly bearded, the stamens in number more than double the petals and each bearing an oblong or linear anther. There are 5 species, natives chiefly of the tropics, one widely dispersed through both the Old and New Worlds, one Polynesian, and one South African. They are shrubs or trees, smooth or tomentose, often armed with spinescent heavy hear alternate entire leaves, often in branches. They bear alternate entire leaves, often in clusters. The flowers are whitish, larger than in most of the order, and arranged in short axillary cymes. X. Americana, a native of the West Indies, Florida, and Mexico, is known as tallow-nut (which see), in Florida as hop-plum and vidul time, and in the West Indies as mountain-plum, waaside plum, and false sandalwood.

(Linnæus, 1748), \langle L. xiphias, \langle Gr. $\xi\iota\phi\iota\alpha\varepsilon$, a swordfish, a sort of eomet, \langle $\xi\iota\phi\iota\varepsilon$, sword.] 1. The typical genus of Xiphiidæ, now restricted to swordfishes without teeth or ventral fins, and thus exclusive out feeth or ventral fins, and thus exclusive of the sailfishes and spear-fishes (Histiophorus and Tetrapturus). The dorsal fins are two, the first high and falcate, and the second very small and situated on the tail, opposite the small second anal. In younger individuals, however, teeth are present, and the two dorsals are connected, so that the banner is more like that of a sailfish. The first anal resembles the first dorsal, but is smaller and less falcate; the pectorals are moderate and falcate. The caudal keel is single; the skin is rough an anked, or in the young has rudimentary scales. X. gladius is the common sworldish, widely dispersed in both Atlantic and Pacific Oceans, attaining a weight of 300 or 400 pounds, with the sword a yard long. It is dark-bluish above, dusky below, with the sword blackish on top. See cut under swordfish.

of which 8 are European and about 20 North American. X. cinerea, of the United States, is called the ash-gray pinion, and its larva bores into green apples and peaches, and

feeds upon the foliage of various trees. Three of the British

species are fancifully named respectively the conformist, X. furcifera (X. conformis), the nonconformist, X. lambda, and the gray shoulder-knot, X. ornithopus.

Xylinidæ (zī-lin'i-dē), n. pl. [NL. (Guenée, 1852), \(Xylinu + -idæ. \)] A family o' noctuids, named from the genus Xylina, many of which

named from the genus *Nylina*, many of which are known as shark-moths. They have the antenne almost always simple, well-developed palpi, thorax robust, wings oblong, with longitudinal markings, and somewhat plicated when at rest, giving the insect an elongated appearance. The family includes about 20 genera. **xylobalsamum** (z̄i-l̄ō-lal'sa-mum), n. [⟨ L. xylobalsamum ⟨ Gr. ξυλοβόλσαμον, the wood of the balsam-tree, ⟨ ξίλον, wood, + βάλσαμον, balsam.] 1. (Smith, 1798), so called from the woody apple-like fruit; $\langle \text{Gr. } \xi i \lambda \sigma v, \text{ wood.} + \mu \bar{\eta} \lambda \sigma v, \text{ apple.} \rangle$ A genus of apetalous plants, of the order *Proteuceæ* and of apetalous plants, of the order Proteaccæ and tribe Grevillecæ. It is characterized by opposite leaves, densely spicate flowers, an ovary with two ovules laterally affixed, and a hard, nearly indehiseent, somewhat ovoid fruit. The 5 species are all Australian. They are trees or tall shrubs, with opposite entire or apiny-toothed leaves. The flowers are of medium size, sessile in pairs under the bracts of a dense spike, which is commonly perfect below, but in the upper part sterile. The spikes are opposite or axillary, or crowded into a terminal cluster which finally becomes lateral. X. ppriforme, the woodenpear tree of New South Wales, is remarkable for its fruit, which is exactly like a common pear in size and shape, but attached by the broad end and composed of a hard woody substance difficult to cut; when ripe it splits lengthwise, discharging a flat winged seed. The tree grows from 20 to 40 feet high, 6 to 8 inches in diameter, producing a dark-reddish wood, used in cabinet-work.

Xylophagi (zi-lof'a-ji), n. pl. [NL., pl. of Xylophagus, q. v.] 1. In Latreille's system of elassification, the second family of his tetramerous Coleoptera, containing many forms now distributed among the Bostrichidæ, Mycetopha-gidæ, Cioidæ, Lathridiidæ, Cucujidæ, Colydiidæ, and Trogositidæ.—2. In Meigen's classification,

same as Xylophagidæ.

Xylophagidæ (zī-lō-faj'i-dē), n. pl. [NL. (Stephens, 1829), < Xylophagns + -idæ.] A famiy of brachycerous dipterous insects, typified by the genus Xylophagus. They have the costal vein encompassing the entire wing, and the tible spurred. Their larve live in dead and decaying wood, and the adults are found most commonly on tree-trunks in high places in the woods. About 60 species are known. Compare Beridæ.

xylophagous (zī-lof'a-gus), a. [⟨Gr. ξύλοφάγος, wood-eating, ⟨ξύλον, wood, + φαγείν, eat.] 1.

Wood-eating; habitually feeding upon wood; lignivorous, as an insect. See Cis (with cut).— 2. Perforating and destroying as if eating tim-

(Linnæus, 1763), for * Λ ylopicros, so called from the bitter wood; ζ Gr. $\xi \dot{\nu} \lambda o \nu$, wood, $+ \pi \iota \kappa \rho \dot{\sigma} \varsigma$, bitter.] A genus of plants, of the order Anonaceæ, type of the of plants, of the order Anonaceæ, type of the tribe Xylopieæ. It is characterized by flowers with a conical receptacle bearing externally numerons stamens with truncate anthers, in the center excavated and containing from one to five carpels, each with two to six ovules. There are from 30 to 40 species, natives of the tropics, chiefly in America, but with several in India and Africa. They are trees or shrubs with coriaceous and commonly two-ranked leaves. The flowers are solltary or clustered in the axils, and are nearly or quite sessite, each with six petals, the outer elongated, thick, boat-shaped, curving, erect, and almost meeting at the summit, surpassing the three inner petals. The fruit consists of oblong or elongated berries produced on a convex receptacle. X. Ethiopica, of western tropical Africa, is the source of African, negro, or Guicea pepper; it is a tree with pointed ovate leaves, and a fruit consisting of several dry black quili-like aromatic carpels about 2 inches long. These are sold in native markets as a stimulant and condiment, and were formerly imported into Europe, forming the piper Ethiopicum of old writers. For X. polycarpa, of tropical Africa, see yellow dye-tree (under yellow). From the pervasive flavor of their wood various American species are called bitter-wood, especially X. ylabra in the West Indies and X. frutescens in Guiana. The fruit of X. sericea in Brazil serves as a spice, and its bark torn from the tree in ribbon-like strips la twisted into coarse cordage, and would be avallable for matting. X. frutescens, known in Brazil as embira, has similar uses. Several species have formerly been classed under the general Unona, Uraria, and Habzelia.

Xylopiae (zī-lō-pī'ē-ē), n. pl. [NL. (Endlicher, 1836), ⟨Xylopia + -eæ.] A tribe of polypetalous plants, of the order Anonaccæ. The twenty-fifth letter y-. in the English alphabet. It

in the English alphabet. It has both a vowel and a consonant value. The character (as was pointed out under U) is the finally established Greek form of the sign added by the Greeks next after T (which had been the last Phenician letter) to express the oo (5)-sound; U and V are other forms of it, which have kept more nearly their original place and value. As a Greek vowel, Y underwent a phonetic change which made of it the equivalent of the present French u, German û, a rounded i, or a blending of the i and u acounds; and in the first century B. e. it was added by the Romans to their alphabet (which had till then ended with x) to express this sound in the Greek words borrowed into their language. With the same value it passed slao into Anglo-Saxon use; but its sound gradually changed to that of a pure or unrounded i; and then its (urther development into a sign for both vowel and consonant, in being ont only exchanged with it in diphthongs and vowel-digraphs—as a iau, eiey, oiey—but also commonly used by itself as the vowel of a syllable, as in by, deny, sulph, iying, taking the place of i both at the end of a word (since no proper English word except the pronoun I is allowed to end with i) and elsewhere, and constantly exchanging with i and ein the different inflectional forms of the same words: as, youn, ponies; pretty, prettier; deny, denies, denied, denier; and soon. In Anglo-Saxon y properly expressed the mixed sound it; but it early began to interchange with, and in Middle English the two became convertible, y being often substituted for ins being more legible, and as affording, especially at the end of a word, an opportunity for a calligraphic flourish. Hence its present prevalence at the end of words, while in the inflected forms the older its returned, families, the plural of familie, remaining beside family, the hourished spelling, without the original final e, of familie. As a vowel-sign, y is a superfluity in our alphabet, signifying nothing which would not be just as well signified by i. The consona

yak (yak), n. [< Tibetan gyak.] The wild ox of Tibet, Poëphagus grunniens, or any of its domesticated varieties; the grunting ox. The yak is a remarkable instance of the development of the pelagunder climatic influences. The modification is like that seen in the musk-ox of arctic regions, Ovibos moschatus, though stitude has done for the yak what has resulted from Intitude in the case of the musk-ox. The body is covered with very long hair langing from the shoulders, sides, and hips nearly to the ground, and the tail bears a heavy brush of long hairs. The wild animal, which inhabits the nonntains of Tibet about the snow-line and descends into the valleys in winter, is of a blacklish color; the back is humped; and the general form is not unlike that of the bison, though the long hair gives the animal a different appearance. The actual relationships of the yak are with the humped Asiatic cattle of which the zebu is the best-known demesticated stock. The yak is of great economic importance to the Tibetans, and has been domesticated. In this state it sports in many color-variations, like other cattle. It is used as a beast of hurden, makes excellent beef, and yields rich milk and butter; the long silky hair is spun and woven for many fabrics. The tails when mounted furnish the fly-anappers or chowries much used in India, and they are also dyed in various

colors as decorations and ceremonial insignia. The elephant-headed god Ganesa is usually represented as flourishing the chowry with his trunk over the heads of various personages of the Hindu pantheon. Yaks have often been taken to Europe, where they are kept in menageries, and have repeatedly been bred in confinement. The yak crosses easity with some other cattle, producing various mixed breeds. A tuberous root of a plant of the genus Dioscorea, particularly if belonging to one of numerous species cultivated for their esculent roots; also, such a plant itself. The plant is commonly a slender twining high-elimbing vine, in some species prickly; the root is fleshy, often very large, sometimes a shapeless mass, sometimes long and cylindraceous, varying in color from white through purple to nearly black. The yam is propagated by cuttings from the root, or also in some species by sxillary hubblets. The root contains a large amount of starch, sometimes 25 per cent., is hence highly nutritious, and in tropical lands largely takes the place of the potato of temperate climates. It lacks, however, the dry mealtiness of the potato, and is on the whole rather coarse, and not as a rule highly esteemed by people of European rasees. It is cooked by baking or boiling, and is in the West Indies sometimes converted into a meat used for making cakes and puddings. It was a cant, favorite word with farmer Jonathan Hastings, of Cambridge, about 1713. Two aged ministers, who were at the college in that town, have told me they remembered it to have been then in use among the students, but had no recollection of it before that period. certain. (a) According to a common statement, Yankee, as used in the plural Yankees, is a var. of Yenkees or Yengees or Yaunghees, a name said to have been given by the Massachusetts Indians to the English colonists, being, it is supposed, an Indian corruption of the E. word English, or, as some think, of the F. Anglais, English (in the latter case the statement must refer to the Indians of Canada, the only ones in contact with the French). The word is said to have been adopted by the Dutch on the Hudson, who applied it to the people of New England (it is said, "in contempt," but prob. not more in contempt there exists a contempt to the contempt of the cont than any other designation of them). (b) In another view, the name Yankee was derived from the adj. yankee as given under yankee¹. Some connect yankee¹ with the preceding theory by assuming it to be a corruption of the Indian Yengees or Yenkees or Yankees as applied to the English, as if 'English' articles meant necessarily 'excellent' articles. Others identify Yankee' with yankeel, 'excellent, smart'; but this sense does not seem to have been common, if existent, in New England use; and the theory is otherwise untenable.] I. n. 1. 4. The fundamental unit of English long measure. The prototype of the British imperial yard (to which the United States Office of Weighta and Measures conforma, though without express authority) was legalized in 1855. It is a bar made of a kind of hronze or gunmetal known as Baily's metal. It has a square section of 1 inch on the sides, and is 33 inches long. But at 1 inch from each end a well is drilled into one of its surfaces so that the bottom is in the central plane of the bar, and into the bottom of the well is sunk a gold plug, upon whose mat surface is engraved one of the two defining lines. The yard is defined as the distance between these lines at 62° E, with the understanding that the bar is to be supported in a particular manner, and that the thermometers are to be constructed according to certain rules. The lines are designed to be looked at with the microscopes of a comparator; but they are not so free from hiur that their middles can be determined more nearly than to a millionth part of the distance between them. This standard was made after the practical destruction of the previous legal prototype, that of 1760, in the burning of the Houses of Parliament, October 16th, 1834, and was iegalized as a new prototype because its length agreed with what had been recognized in 1819 by the Standards Commission as the scientific standard yard—namely, with a certain scale, known as Shuckburgh's scale, having been made in 1794 by Troughton for Sir George Shuckburgh, who in his comparisons of it first introduced the comparator with micrometer microscopes. This scale was a copy of another which had been made for the Royal Society in 1742, from which the standard of 1760 was copied. This was a bar having upon one side two gold studs, each with a dot pricked upon it; and it was used by bringing the points of a beam-compass into these dots, which had thus soon become badly wern. Older standards still extant are those of Queen Elizabeth and of Henry V 4. The fundamental unit of English long mea-

Gothic architects of England more usually employed a Gothic architects of England more usually employed a foot of 13; modern inches, a unit probably derived from France; and the oldest works show a foot of 12½ modern inches, no doubt the old Saxon foot, agreeing very nearly with the Rhineland foot of modern Germany. Some British remains, as Stonehenge, were evidently constructed with Roman measures. The Standards Commission of 1819 reported that 37 inches of cloth were frequently given for each yard, which is almost precisely Rhenish measure. They also found focal yards of 38 and 40 inches. As a cloth measure, the yard is divided into 4 quarters = 16 nails. (See cloth-measure, under measure.) A square yard contains 9 square feet, and a cubic yard 27 cubic feet. Contracted yd.

That there might be no Abuse in Measures, he [Henry 1.] ordained a Measure made by the Length of his own Arm, which is called a Yard. Baker, Chronicles, p. 38. 5. Naut., a long cylindrical spar having a rounded taper toward each end, slung crosswise to a mast and used for suspending certain of the sails called either square or lateen sails according as the yard is suspended at right angles or obliquely. Yards have sheave-holes near their extremities for the sheets reeving through. Either end of a yard, or rather that part of it which is outside the sheave-hole, is called the yard-arm; the quarter of a yard is about half-way between the sheave-hole and the slings. Going upward from the deck, the yards are known as the lower yards, topsail, topgallant, and royal-yards, except where double topsails are used, when the topsail-yard is replaced by the lower and upper topsail-yards. Lower yards and topsail-yards are sometimes made of fron, and hollow. See cuts at abox, a-cockbill, cockscomb, and ship.

yawner (yâ'ner), n. One who yawns.
yawning (yâ'ning), n. [Verbal n. of yawn, v.]
Gaping; oscitation; the taking of a deep inspiration, followed by a slight pause, and then a prolonged expiration, tho mouth being more a protonged expiration, the mouth being more or less widely open. The act is reflex and involuntary in character, though it can often be partially repressed by a strong efort of the will. It is the physiological expression of fatigue and of a desire to sleep, but is also excited by insufficient oxygenation of the blood, and occura therefore in conditions of lowered vitality, in the prodromal stage of many diseases, and after profuse losses of blood. The sight of another person yawning is also provocative of the act.

Yea is now used only in the sacred, solemn, or formal style. Yea, being mainly a word of assent, was formerly used chiefly in answer to questions framed affirmatively; yes, a stronger term, was chiefly used in answer to questions containing a negative or otherwise implying a doubt. But the distinction does not appear to have been rigidly maintained; and the assertions of the following quotations about yea and yes, like those about nay and no (see not), must be taken with some allowance.

I woulde not here note by the way that Tyndall here

maintained; and the assertions of the following quotations about year and yes, like those about nay and no (see not), must be taken with some allowance.

I woulde not here note by the way that Tyndall here translateth no for nay, for it is but a trifle and mistaking of the englishe worde, sauing that ye shoulde see that he, whych in two so plain englishe wordes, and so commen as is naye and no, cannot tell when he should take the tone, and when the tother, is not, for translating into englishe, a man very mete. For the vae of those two wordes in annawering to a question is this. No fread nayl annawereth the question framed by the affirmative. As, for ensample, if a manne should aske Tindall hymselfe: "ys an heretike mete to translate holy scripture into englishe," Lo, to thys question, if he will aunswere trew englishe, he muste aunswere nay, and not no. But and if the question be asked hym thus, lo: "is not an heretyque mete to translate holy scripture into english?" To this question, lo, if he wil aunswer true english, to make the same true english. To this question be asked hym thus, lo: "so not an heretyque mete these two adnerbs, ye and yes. For if the question bee framed vnto Tindali by thafirmatine in thys fashion: "If an heretique falsely translate the newe testament into englishe, to make hys false heresyes seeme the worde of Godde, be hya bookes worthy to be burned?" To thys question asked in thys wyse, wy he wyl aunswere true englishe, to make hys false heresyes seeme the word of God, be not his bokes well worthy to be burned?" To thys question in thys fashion framed, if he wyll aunawere true englishe, to make hys false heresyes seeme the word of God, be not his bokes well worthy to be burned?" To thys question in thys fashion framed, if he wyll aunawere true englishe, to make hys false heresyes seeme the word of God, be not his bokes well worthy to be burned?" To thys question in thys fashion framed, if he wyll aunawere true englishe, to make hys false heresyes seeme the word of God, be not his boke

There is an example of the rejection of a needless subtlety in the case of our affirmative particles, yea and yes, nay and no, which were formerly distinguished in rise, as the two affirmatives still are in our sister-tongues, the Danish and Swedish. The distinction was that yea and nay were answers to questions framed in the affirmative; as, Will he go? Yea or Nay. But if the question was framed in the negative, Will he not go? the answer was Yes or No. G. P. Marsh, Lects. on Eng. Lang., xxvi.

A full round of the seasons; the period of the earth's revolution round the sun: more accurately, the interval between one vernal equinox and the next, or one complete mean apparent circuit of the ecliptic by the sun, or mean motion through 360° of longitude. This is specifically the tropical year, which determines the sequence of the seasons (sometimes also called the astronomical or solar year). Its length is about 365 days, 5 hours, 48 minutes, 46 seconds. Owing to the precession of the equinoxes, this is less than the length of the sidereal year, the true period of the sun's revolution, or his return to the same place in relation to the fixed stars, which is 365 days, 6 hours, 9 minutes, 9.3 seconds. See also style1, n., 9. Abhrevlated y., yr.

A space of about 365 days, used in the civil or religious reckoning of time; especially, the usual period of 365 or 366 days, divided into twelve calendar months, now reckoned as beginning with the 1st of January and ending with the 31st of December: as, the year 1891 (see legal year, below); also, a period of approximately the same length in other calendars. Compare calendar—4. A space of twelve calendar months without regard to the point from which they are reckoned: as, he sailed on June 1st, and was absent just one year.

II. n. 1. The color of gold, butter, the neutral chromates of lead, potassa, etc., and of light of wave-length about 0.581 micron. It has some remarkable properties, which are due to the fact that by far the greater part of the visible spectrum consists of two regions, in either of which any three colors being taken a suitable mixture of the extreme ones will match the middle one, and that the yellow is about the middle of one of these regions which contains four fiths of all the visible light of the solar spectrum. This region is bounded by the scarlet and the enerald-green; the other by the emerald-green and the violet-blue. These three colors are thus the only ones which cannot be matched by mixtures of others. They are also more chromatic or high-colored than those which fall between them in the spectrum; for which reasons physicists regard these three colors as the elementary ones. (See color.) A remarkable property of yellow is that an increase of light merely intensifies the sensation with a slight heightening of the color, without changing the hne; while blue, on the other hand, is rendered pale by increased illumination, and all other colors are rendered yellowish. The name yellow is restricted to highly chromatic and luminous colors. When reduced in chroma, it becomes buff; when reduced in luminosity, a cool brown. Mixed with red, yellow goes over into orange; mixed with green, into yellow geen. Lemon-yellow and canary-yellow may be taken as pure yellows, the latter being a little greener. Sulphur-yellow is a little greenish; primrose is a little greenish and pale; gamboge is a very slightly orange yellow. By chrome-yellow are orange-yellows; Naples yellow and maize-yellow and wax-yellow and eon somewhat diminished chroma, the first a little orange, and the last a little greenish and pale; and wax-yellow are of somewhat diminished chroma, the first a little orange, and the last a little green. It is impossible to describe the yellows more precisely, as the slightest causes—for example, a little thicke change their hues decidedly.

A tree of the genus Taxus, the common yew being T. bueeata of temperate Europe and Asia. This is a slow-growling and longlived evergreen of moderate height and spreading habit, with a thick irregular trunk and dark thick foliage. In Europe the yew has long been planted in graveyards. There are several dwarf, weeping, and variegsted varieties. The golden yew has the edge of the leaves in spring of a hright-golden yellow. The Irish yew (var. fastiquata) has erect branches, and is more hardy than the typical form, which will not endure the winter in the northern United States. The wood of the yew is heavy, fine-grained, and elastic, and was formerly much used for bows, the supply being protected by government. It is considered a very choice cabinet-wood, the heart being of a fine orange-red or deep brown, and the sap-wood white. The leaves of the tree are poisonous.

yolk¹ (yōk), n. [Also yelk; < ME. yolke, yelke, <
AS. geolea, yolk, lit. 'the yellow part,' < geolu,
yellow: see yellow.] 1. The yellow and principal substance of an egg, as distinguished from
the white; that protoplasmic content of the ovum of any animal which forms the embryo in germination, with or without some additional substance which serves to nourish the embryo during its formation as distinguished from a mass of albumen which may surround it, and from the egg-pod or shell which incloses the whole; the vitellus, whether formative wholly from the egg-pod or shell which incloses the whole; the vitellus, whether formative wholly or in part. In holoblaste ova, which are usually of minute or microscopic size, the whole content of the cellwall is yolk which undergoes complete segmentation, and is therefore formative or germinal vitellus, or morpholecithus. In large meroblastic eggs, however, such as those we eat of various birds and reptiles, the true germyolk forms only the nucleus and a relatively small part of the whole yolk-ball, which then consists mainly of foodyolk or tropholecithus. This is the yolk of ordinary language, forming a relatively large ball of usually yellow and minutely granular substance which floats in a mass of white or coloriess albumen, inclosed in a delicate pellicle, or vitelline membrane, and is steadied or stayed in position by certain atrands of stringy albumen forming the chalaze. The quantity of germ- and of foodyolk relatively to each other and also to the amount of white varies much in different eggs, as does also the relative position of the two kinds of yolk. (See ectolecithal.) In the largest eggs, as of birds, the great bulk results from the copionsness of the white and of the food-yolk, and the germ-yolk appears only at a point on the aurface of the latter, where it forms the so-called tread or cicatricula. Some eggs contain more than one yolk, but this is rare and anomalous. See egg, ovum, and vitellus; also segmentation of the vitellus (under segmentation), and cuts under gastrulation, The tother [man] was zalowere thene the zolke of a naye [an egg].

tribe | Draceace. It is characterized by a distinct
woody stem, numerous panieled roundish or bell-shaped
flowers with nearly or quite separate perianth-segments,
small anthers sessile on a club-shaped filament, and an
ovary with numerous ovules. There are about 20 species,
natives of the United States, Mexico, and Central America.
They are low upright perennials, sometimes trees, often
with numerous branches. Their leaves are linear-lanreolate and thick, usually rigid and spiny-tipped, and
crowded at the apex of the stem or branch. The bandsome
pendulous flowers are large and usually white or creamcolored, attaining a length of 3 inches in Y. baccata, and
form a showy terminal inflorescence often several feet long,
seated among clustered leaves or raised on a bracted peduncle. The fruit is either a dry loculicidal capsule or a
pendulous berry which is fleshy or pulpy, sometimes cylindrical and clongated; in Y. brevifolia it becomes dry and
spongy. The rootstock is saponaceous, and in Y. Treeubeau and other species is much used by the Mexicans for
soap—being included with various similar products under
the name amole. The leaves yield a course fiber; the
tailer species also produce a fibrous wood which is heavy,
spongy, and difficult to cut or work; it shows distinct
concentric rings, unlike that of most monocotyledonous
plants. Some species are said to reach the height of 50
feet and the thickness of 5 feet. The species are most
numerous in the southern United States and northern

Mexico; one, I. angustifolia, extends from New Mexico to the Dakotas; three are Californian; three are well-known plants of the Southern States, I. filamentosa, Y. aloifolia, Y. gloriosa (including F. recurvifolia), all decorative plants, mostly stem-less, thriving in poor soil, even in drifting sand of the coast: their flowers are white, tinged sometimes with green, yellow, or purple; they furnish a hisrsh, brittle, but very strong fiber, called dagger-fiber, used for packing and as a rude cordage. From their sharp-pointed leaves with threads hsuging from their edges, Y. filamentosa and Y. aloifolia are known as Adam's needle and thread and as Eve's thread; the former is also called silk-grass (which see), and sometimes bear-grass, Its young pulpy stems being eaten by bears. Y. aloifolia salso known in the Southern States and in the West Indies as Spanish dagger and dagger plant. Y. gloriosa is the dwarf palmetto, or mound-lily. The preceding and several others are favorites in cultivation, chiefly mader the name yucca; 8 species cultivated near Nice now begin to form a characteristic feature of some parts of the Mediterranean coast. Some species yield an edible Iruit, as Y. baccata, the Spanish bayonet, or Mexican banana, a native of Mexico, extending into western Texas, New Mexico, and southern parts of Colorado and California; a strong coarse fiber, made into rope by the Mexicans, is procured from the leaves by macerating them in water. The name Spanish bayonet is also applied to other species, especially to Y. constricta (Y. elata), which occurs in Mexico and the United States from western Texas to Utsh, grows from 9 to 15 feet high, and produces a light-brown or yellowish wood; and to Y. Treculeana (including Y. canaliculata), a long-leafed species of Texas and Mexico, sometimes 25 feet high and 2 feet thick, producing a bitter but sweetish fruit which is cooked and eaten by the Mexicans. It has its branches sll near the top, produces great numbers of showy white flowers of a porcelain luster, followed by

This notion, absurd with regard to the alleged connection of thought, is also phonetically impossible; the AS. word for wheel was hueol, and possible; the AS. word for wheel was hreeol, and could have no connection with geol. Another explanation connects the word with yavel, yavel, howl, cry; as if yule was orig. the 'noise' of revelry. This is also untenable. 1. The twenty-sixth character in the English alphabet, and the last, as in that of the later Romans. In the Phenician system, from which ours comes through the Latin and Greek, it was the seventh sign. The comparison of ancient forms, including the Egyptian as perhaps the original (compare A), is as follows:

な

Early Greek and Latin.

Egyptiao. Hieroglyphic. Hieratic.

Hieroglyphic. Hieratic. Phenician Greek and Latin. The same character has a corresponding place as zeta in the Greek series, and went over in that place to the Italian alphabets; but, about the third century B. C., it was dropped out by the Romans as not needed, and the newly devised G (see G) was put in its place. Then finally, some two centuries later, it was taken back (together with or soon after Y: see I') to express in horrowed Greek words the peculiar double sound (ds er sd) which it had won in Greek usage, and so appeared anew in its old company, but with greatly altered position. It was not used in the oldest English, but came gradually in out of the French in the fifteenth century and later. With us, as in French, it has lest its value of a compound consonant, and expresses the sonant or voiced sibilant sound corresponding to s as surd or breathed sibilant. The proper z-sound is also, and even much oftener, written by s, as in roses, and in a few words (as possess, dissolve) by domble s, and yet more rarely (for example, sacrifice) by c. The sound is a common one in our English pronunciation—not much less than 3 per cent. (the surd s being 43 per cent.). As initial, the character z is written mostly in words of Greek origin, but as final (almost always with silent e added) it is found in many Germanic words, as freeze, grazz. It occurs sometimes double, as in buzz, buzzard. The corresponding sonant to our other sibilant (written in this work with zh, after the example of sh) is spelled with either s or z, as in pleasure, azure. It is the rarest of our consonant sounds, counting for only a fiftieth of 1 per cent. of our utterance. In certain Scotch words and names, as capercalizie, Dalziel, z is written for the y-sound. In the United States the character is generally called zee; in England, generally zeed (from zeta); izzard (which see) is an old name for it.

Two species occurring in the United States are the rose-breasted and the black-headed, Z. ludo-viciana and Z.melanocephala. (See cut under rose-breasted.) The latter inhabits the western United States from the plains to the Pacific, where the former is not found, and extends into Mexico. The adult male has the crown and sides of the head, the back, the wings, and the tail black, the wings and tail much varied with white, and the neck all around and the under parts rich orange-brown, inclining to pure yellow on the belly and the lining of the wings. The bill and feet are grayish-blue. The length is about \$\frac{1}{2}\$ inches, the extent 12\frac{1}{2}\$. The femsle differs much from the male, but has the same rich yellow under wing-coverts. Also called Habia.

soil, pinnate leaves, and naked truncate strobile-scales, both the male and female cones being oblong and cylindrical and their scales similar. There are about 30 species, natives of tropical and subtropical North America. They produce a simple, lobed or branching caudex, sometimes a low trunk, often covered with scars. The stems increase in height by the yearly development of a crown of stiff fern-like leaves with firm rigid segments which are entire or serrate, parallel-nerved, and jointed at the broad hase. Z. interribia (Z. pumila), with a short globular or oblong, chiefly subterranean stem, occurs in low grounds in southern Florids, and is the only cycad found within the United States; it yields a starch known as Florida arrowroot; the plant is called coontie (which see). Z. funfuracea and the preceding are known as wild sago in Jamaica. From these and other dwarf species an excellent arrowroot is made in the Bahamas and elsewhere in the West Indies. Many species cultivated under glass as zamia are now classed as Encephalartos, and Z. spiralis as Macrozamia.

They have been found in the Lower Lias, the Coralline limestone, the Wealden, and the Miocene.

Zamites (zam-i'tēz), n. [NL.. < L. zamia, assumed to mean 'a fir-cone.'] The name given by Brongniart to certain fossil plants belonging

to the eyeads, and considered to be more or less closely allied to the living Zamicæ. The genna Zamitæ first appears in the Trias, but is especially well developed in the Jurassic; it continued through the Cretaceons, and finally disappeared in the Miocene. There have been about 30 species described. The cycadaceons flora played an Important part in the vegetation of Greenland and Spitzbergen during the Jurassic epoch, giving an almost tropical aspect to the forests of that region and epoch. Varions other genera of cycads allied to Zamitæs have been established, chiefly, if not entirely, based on the forms of the leaves and their segments. Among these are Glossozamitæs, a genus with long elliptical leaves, found in the Lower Cretaceous; and Otozamitæs, with small elliptic-lanceolate leaves, divided into aeveral groups in accordance with the very varying form of the segmenta of the leaf. The latter genus runs through the whole of the Jurassic, as far as the lower division of the Upper or White Jura, when it gives way to the genus Zamitæs. It has not been observed in the Jurassic rocks of the arctic regions. Ptlophyllum, Ctenophyllum, Ptlozamites, Pterozamites, Anomozamites, and Sphenozamites and to one another.

Middleton, Blurt, Master-Conatable, iii. I.

Syn. I. Clown, Fool, Bufoon, Minnie, Zany. "The zany in Shakespere's day was not so much a bufoon and minne as the obsequious follower of a bufoon and the attenuated minne of a minnie. He was the vice, servant, or attendant of the professional clown or fool, who, dressed like his master, accompanied him on the stage or in the ring, following his movements, imitating his tricks, and adding to the general merriment by his ludicrous failures and comic imbeeility. . . The professional clown or fool might be elever and accomplished in his business, a skilful tumbler and mountebank, doing what he undertook to do thoroughly and well. But this was never the case with the zany. He was always slight and thin, well-meaning, but comparatively helpless, full of readiness, grimace, and alacrity, but also of incompetence, eagerly trying to imitate his superior, but ending in failure and absurdity. . . . We have ourselves seen the clown and the zany in the ring together, the clown doing clever tricks, the zany provoking immense laughter by his Indicrous failures in stempting to imitate them. Where there is only a single clown, he often combines both the characters, doing skilful tumbling on his own account, and playing the zany to the ridera." (Edinburgh Rev., July, 1869, art. 4.)

Zea (z̄d'ā), n. [NL. (Linnæus, 1737; used earlier by Brunfels, 1530), ⟨ Gr. ζta, ζειό, a sort of grain used as fodder for horses.] A genus of grasses, type of the tribe Maydeæ. It is characterized by monecious flowers, the male forming a terminal panicle, the female a large axillary aessile apike wrapped in numerona leaf-like bracta or husks, and consisting of pistillate flowers densely aggregated in many rows upon a thick unjointed rachis. The only species, Z. Mays, the well-known Indian corn or maize, long cultivated throughout many warm and temperate regions, is supposed to be a native of America, but is not now known in a wild state. It is a tall plant with unbranched robust stems, large light-green leaves, a handsome long-staked terminal panicle (known as the tassed), and very thick fertile spikes from the husks of which project long green alender styles known as the silk. The fruit is a hard roundish caryopais (known as the kernel) partly inclosed by the chaffy remains of the four glumea and broad palet—the kernels and their rachis (the cob) forming the apike or ear of corn. The aceda furnish an invaluable food to man and to domestic animals; the stakks and leaves are used for fodder, and the husks are much used for filling mattresses and horse-collars, and for making door-mats; a coarse textile fabric, also, and paper of excellent quality, have been experimentsily made from them. The cob, and sometimes the whole ear, is used as fuel. The chief value lies of course in the kernel. See maize, cut in preceding column, and cut under husk. Compare corn.

very fully and regularly atriped with black: It is specifically called the mountain zebra. This zebra atands about 4½ feet high at the shoulder; the head is light, the ears are moderately large, the limba slender; the mane is short, and the tail tufted. The general form is light and symmetrical, like that of most wild asses, and seems to indicate speed rather than bottom. The zebra is one of the most beautiful of animals, as it is also one of the wildest and least tractable. It has often been kept in confinement, and occasionally tamed, but generally retains its indomitable temper. It inhabits in herds the hilly and mountainous countries of South Africa, seeking the most seeluded places; so that from the nature of its haunts, as well as its watchfulness, swiftness, and the acuteness of its senses, it is difficult to capture. It is, however, much hunted, and seems destined to extermination.

Ind. zobo, q. v.] The Indian bull, ox, or eow; any individual or breed of Bos indicus, having a hump on the breed of Bos indicus, having a hump on the withers. The zebu has been domesticated from time immemorial, and is now known only in its artificial breeds. These are numerous, and very various in size, shape, and color, the processes of artificial selection having modified the original stock in almost every particular. The characteristic hump is sometimes double. The fiesh is considered a delicacy. The size of different breeds of zebus varies much. Some are as large as ordinary cattle, others no larger than a common calf a month or two old. The color is usually light gray, varying to pure white. The bulls of the latter color are consecrated to Siva, and become Brahminy bulls, exempt from labor or molestation. Zebus are bred particularly in India, but also in China, Japan, and some parts of Africa. They are used as heasts of burden and of draft, and as riding-animals, as well as for beef. The stock from which they have descended is

Zechstein (zek'stin), n. [G.. < zeche, a mine, + stein, stone.] In geol., the uppermost of the two divisions of the Permian, the lower being the so-called "Rothliegende." This twofold character of the Permian is a well-marked feature of the system in Germany, especially in the central part of that country; hence it is not infrequently called the Dyas, a word coined in inflation of the name Trias. At the bottom of the Zechstein is the "Kupferschiefer," a thin bed of dark-colored, bltumhous, and cupriferous shale. The Zechstein proper is a calcareous rock, becoming dolomitic in its upper section, and containing, especially in Prussia, masses of rock-salt of extraordinary thickness. The Permian covers an extensive area in Russia, where, however, its dual character is much less distinctly marked than it is in Germany. In the east of England this feature of the Permian is clearly exhibited, and the so-called "Magnesian Limestone group" is the equivalent of the German Zechstein. No separation of the Permian into divisions has been satisfactorily made out in North America, where the break between that formation and the Carboniferous is far less distinct than it is in the regions of its typical development in Germany.

Zelkova (zel-kō'vä), n. [NL. (Spach, 1841), from the Cretan name zelkova.] A genus of apetalous trees, of the order Urticaccæ and tribe Collider. apetalous trees, of the order Urticaeeæ and tribe Celtideæ. It is characterized by monœcious or polygamous flowers, the male with a short-lobed periauth, the female with an eccentric two-parted style and unlovulate ovary, in fruit somewhat ventricose and drupaceous, smooth or velny on the surface, and often keeled on the back, containing a compressed concave seed with broad cotyledons. There are 4 species, natives respectively of Crete, the Caucasian and Caspian region, Japan, and China. They are trees bearing alternate serrate or crenate feather-veincd leaves, with narrow slender stipules. The flowers are sessile or short-pedicelled, the male in small clusters, the female solitary in the upper axils. Z. crenata (formerly known as Planera Richardt), the zelkova- or zelkona-tree of the Caucasus, reaches a considerable size, sometimes 80 feet high and 4 feet in diameter; in its scaly bark it resembles the plane-tree, in its leaves the elm; the small greenish-brown flowers have the odor of the elder, and are followed by roundish fruits of the size of a pea. Its timber is much prized; the sap-wood is light-colored and elastic; the hard heavy reddish heart-wood takes a good polish, and is valued for furniture. For Z. accuminata, see keyaki.

It consists of a somewhat large telescope pointing nearly to the zenith, but having a moderate range of motion in altitude regulated by a fine tangent screw. The instrument also carries a vertical setting-circle with a very delicate level, having its tube perpendicular to the herizontal axis of the telescope. There is at the eyepiece a thread micrometer working vertically. The telescope, with its horizontal axis, is mounted upon a very long vertical axis arranged with two stops, so that the telescope can be carried round from the north to the south part of the meridian. The difference of zenith-distances of a pair of stars, one north and the other south, having been observed, the latitude of the station is equal to the mean of their declinations added to half the excess of the southern over the northern zenith-distance. The instrument is the invention of Captain A. Talcott, U. S. A.; but it is said the principle is due to the early astronomer Horrocks.

Zeno of Elea, a philosopher of the fifth century B. C. Zeno's four arguments against motion, which are celebrated, are as follows: First, a body passing over any space must first pass the middle point, and before it can do that it must pass the point midway between that and the starting-place, and so on ad infinium. This regressus ad infinium was regarded as in some way absurd. The second argument is called the Achilles, or Achilles and the tortoise. Achilles cannot overtake the tortoise, because it will take him a certain time to reach the starting-point of the tortoise, and when he has reached it the tortoise will still have the start, and so on ad infinitum; and thus he will be the sum of an infinite series of times in reaching the tortoise, which will be an infinite time. The third argument is that a flying arrow at any time occupies a space no larger than itself, and in this space it has no room for motion, and therefore at no time has it any motion. The fourth argument is quite obscure, but it concludes from the consideration of relative motions that the whole of a time is equal to its half. Zeno may have come upon the diffiently that half an infinite number is equal to the number itself. Aristotle calls Zeno the inventor of dialectic—that is, of abstract logical reasoning reposing upon the principle of contradiction, as opposed to mere inference by vague association with some general experience. The Zenonian arguments are in point of fact attempts at such reasoning; but they are gross logical fallacies, arising from the fact that the reasoning is not carried out abstractly, but contents itself with reaching contradictions with ordinary inexact experience. They have been considered wonderful by those students who have come to philosophy by the way of theology or natural history without proper training in mathematics and logic; and fallacies of the same nature are committed every day, even in mathematical works. Zenonian ninds find some difficulty in ressoning either about discrete or about continu finity, because these characters are neither of them directpresented to us in experience, and therefore clude associationsl reasoning. With finite quantity they find no
such difficulty. But in really logical reasoning, since finite
quantity is distinguished from infinite quantity in being
subject to a certain general and complicated condition to
which the latter is not subject, the latter is more simple
than the former; and from a similar cause continuous infinity is more easily reasoned about, with logical accuracy,
than discrete infinity.

Upon a thermometer or any similar scale zero is the line from which alt the divisions are measured in the positive and negative directions. Upon the centigrade and Réanmur's thermometers, it is the point at which the mercury stands when the thermometer is plunged into a mass of melting lee coarsely pulverized, from which some makers allow the water to drain off, but it is better not to do so. For some years after a thermometer is made the zero is said to rise—that is, the melting-point of fee stands higher and higher upon the scale. Upon the Fahrenheit thermometer the distance on the glass stem between the melting-point of lee and the temperature of steam at one English atmosphere of tension is divided into 180 degrees, and 32 such degrees betow the melting-point of ice is marked as zero.

Zens was worshiped universally; but the most renowned of his sanctuaries were those of Olympia in Elis and Dodona in Epirus. In art Zens was represented as a majestic and powerful figure, with full beard and flowing hair, in early works sometimes fully draped, but in later art, in general, only lightly draped in the himation. The type fixed by Phidias in the second half of the fifth century B. C., in his great chryselephantine statue for the temple at Olympia, influenced all artists who came after him. The usual attributes of the god are a long staff or scepter, the thunderbolt, the eagle, and sometimes a figure of Victory borne on one hand. The head is generally encircled by a fillet or a wreath; in later sculptures the hair rises from the brow in luxuriant locks like a crown, and falls in masses on either side of the face. Compare Jupiter. See cut on preceding page, and cut under thunderbolt.

Dan. zink = Russ. tsink \ddot{u}$ (NL. zincum), $\langle G. zink$, zinc; connection with G. zinn, = E. tin, is doubtful.] Chemical symbol, Zn; atomic weight, 64.9. One of the useful metals, atomic weight, 64.9. One of the useful metals, more tenacious than lead and tin, but malleable only at a temperature between 200° and 250° F. Its ore has long been known, and the manufacture of brass from it has been practised to a considerable extent. Zinc is believed to have been first distinctly recognized as a metal by Paracelsus about the beginning of the seventeenth century; but in the metallic state it has been of importance in the arts only since the beginning of the present century. Native zinc is not positively known to occur; if existing at all, it is exceedingly rare. Its ores, however, are widely disseminated, especially the combination with sulphur, called blende, which is almost as invariably present in greater or less quantity in metalliterous veins as is galena. The localities where zinc ores are abundant enough to be worked with profit are, however, not unmerous. The uses of zinc are unmerous and important. In combination with copper it forms the well-known alloy called brass, which has been known for an indefinite period; it is also one of the ingredients of German silver. Zinc is largely used in the metallic form for roofing and for cornices and the like, also for coating or "galvanizing" sheet-iron to protect it from rusting, and as the electropositive element in many batteries. It is also somewhat extensively used as a pain, in the form of the oxid. This metal is usually a little more expensive than lead, and from half to a third as valuable as copper. Zinc belongs to the magnesium group of metals, in which are comprised glucinum, magnesium, zinc, and cadmium; these are all volatile, burning with a bright fisme when heated in the air; they all form one chlorid and one oxid only. The common commercial name of zinc, as offered for sale in flat cakes or ingots, is spelter.—Butter of zinc. See butter1.—Chlorid-of-zinc paste, See paste1.—Flowers of zinc, zinc oxid.—Granulated zinc, zinc reduced to the form of granules by pouring the mollen metal into water.—Oleate-of-zinc ointment. Zingiber (zin'ji-bèr), n. [NL. (Adanson, 1763; used earlier by Lobel, 1576, and, as Gingiber, by Mattioli, about 1554), ζ L. zingiber, ζ Gr. ζιγγιβερις, ginger: see ginger.] A genus of plants, type of the order Zingiberaeæ and of the tribe Bepic, ginger: see ginger.] A genus of plants, type of the order Zingiberaeæ and of the tribe Zingiberaeæ. It is characterized by a cone-like inflorescence, each flower having a three-celled ovary and a stamen composed of a short filament and an anther with contiguous cells having the connective extended into a long linear appendage—the two lateral stamens either absent or represented by two small adnate staminodes. About 33 species have been described, of which perhaps 23 are distinct. They are natives of India and of islands of the Pacific and Indian Oceans. They are leafy plants with horizontal tuberous rootstocks, the sterile atems differing from the flower-bearing ones. The dense cone of flowers is composed of imbricated bracts, each with from one to three flowers and spathaceous bractlets. The inflorescence is sometimes borne on a leafless scape, more or leas covered with sheaths, in other species terminating a leafy stem, or apparently lateral upon a recurved peduncle. Each flower produces a membranous or hyaline tubular calyx, and a cylindrical corolla-tube dilated into narrow spreading lobes, the posterior one erect and incurved. The fruit is a globose or oblong capsule, finally irregularly ruptured, and discharging rather large oblong seeds with a lacerate aril which is sometimes much larger than the seed. The pungently aromatic roots of several species are the source of the ginger of commerce, especially those of Z. Casmunuar, of India (see cut under yinger). The root of Z. Casmunuar, of India is used as a tonic and stimulant, and is cultivated under the name of cassumunar ginger or Bengal root. Also Zinziber.

Zingiberaceæ (zin*ji-be-rā'sē-ē), n. pl. [NL. (Richard, 1808), ⟨ Zingiber + -aceæ.] An order of monocotyledonous plants, of the series Epigymæ, distinguished from the order Musuceæ by its single perfect stamen. It is characterized

(Richard, 1808), \(\int Zingiber + -acex. \) An order of monocotyledonous plants, of the series \(Epigymxe, \) distinguished from the order \(Musuccxe \) by its single perfect stamen. It is characterized by irregular flowers with distinct calyx and corolla, inferior ovary, ansually arillate seeds, and an embryo in a canal in the center of the albumen. There are over 470 species, of 36 genera, classed in 3 tribes, of which \(Zingiber, Marama, and Canna are the types. \) They are perennial tropical herbs growing from a horizontal thickened rootstock, their leaves chiefly radical, large and ornamental, with numerous parallel veins diverging obliquely from the midrib. Their flowers are often of great beauty, as in species of \(Hedgehim, Alpinia, Curcuma, Kxempferia, and Canna; in many, especially \(Mantisia, \) they resemble orchids. They have a strong tendency to petaloid development, producing richly colored bracts in \(Curcuma; \) three petaloid staminodes and two scales usually represent the five imperfect stamena. The order contains many of the most stimulating aromatics, products derived chiefly from the root or rhizome of the plants ginger, galangale, and zedoary, of the genera \(Zingiber, Alpinia, \) and \(Curcuma; \) also from the fruit or seeds, as cardamons and grains-of-paradise, from species of \(Amomum \) and \(Elettaria. \) The order also yields the valuable dye turmeric from \(Curcuma, a) purple dye from \(Canna, \) and arrowreot from \(Maranta \) and \(Curcuma, \) and eithe fruit by \(Globba, \) and a tough fiber by \(Purquium \) and \(Caluthea. \) Also \(Zinziberacex. \)

zink, n. See zinc. zinke (tsing'ke), n. [G. zinke, a cornet.] A small cornet of wood or horn, once very common in Germany. It had usually seven finger-holes, and a cupped mouthpiece. It was made in several sizes, and both straight and curved. The scripent is properly a development of the old zinke or cornetto.

Zinnia (zin'i-ā), n. [N]. (Linnæus, 1763), named after J. G. Zinn (1727-59), who wrote on the plants of Göttingen.] 1. A genus of composite plants, of the tribe Helianthoideæ, type of the subtribe Zinnieæ. It is characterized by solitary radiate flower-heads with a conical or cylindrical receptacle, the flowers both of the disk and ray being fertile, and those of the ray almost or quite without a tube, and persistent upon the ripened achene; the achenes of the inner flowers each bear from one to three awns. There are 12 species, natives of Mexico, Texas, and Arizona, 2 of which, long entityated in gardens, are now widely naturalized. They are annuals, perennials, or sometimes shrabby plants, bearing opposite entire leaves and rather large and showy flower-heads peduncled at the ends of the branches or in the forks between them. Five species occur within the United States, mostly with lightly yellow or sulphur-colored rays. The enlitivated species are chiefly of various shades of deep red; they have been called youth-and-old-age, from the lasting and somewhat rigid rays and the continued production of new disk-flowers; but are more usually known by the generic name ziunia, especially in the common double form.

Ziphius (zif'i-us), n. [NL. (Cuvier, 1834), prop. Xiphius, ζ Gr. ξιφός, the sword-fish, ζ ξίφος, a sword.] 1. A genus of odontoeete eetaceans, or toothed whales, taken as type of the Ziphiinæ: used with varying restrictions, and in some aeceptations synonymous with Mesoplodon. It was based originally on a skull discovered in 1804 on the coast of France, and supposed to be fossil; the species was named Z. cavirostris by Cuvler. Numerous living individuals have since been found in various seas. There is normally one conical tooth on each side of the lower jaw; the vertebræ are forty-nine in number; and the anterior cervicals are ankylosed, but the posterior are free. These whales are among those known as bottle-nosed whales and cov-fishes, and attain a length of from 15 to 20 feet. The genus is distinct from Hyperoödon; but variations in the dentition have been noted, and the relations of some forms known as Mesoplodon are in questien. Also called Diodon.

zircon (zèr'kon), n. [Cf. Sp. azarcon = Pg. nzarcão, zarcão, < Ar. zarkūn, einnabar, vermilion, < Pers. zarqūn, gold-colored: see jargon².] Amineral occurring in tetragonal erystals of adamantine luster and yellowish to brownish or reddish color: its hardness is somewhat greater than that of quartz. The reddish-orange variety is sometimes called hyacinth in jewelry. The colorless, yellowish, or smoky zircon of Ceylon is there called jargon. Zircon consists of the oxids of silicon and zirconium (Sio ZrO₂), and is usually regarded as a silicate of zircenium, though sometimes classed with the oxids of titanium (rutile) and tin (cassiterite), which have a similar form. See zirconium See zirconima.

zirconate (zėr'kō-nāt), n. [$\langle zircon(ic) + -atc^1 \rangle$]

zirconium (zèr-kō'ni-um), n. [Nl., < zircon.]

Chemical symbol, Zr; atomic weight, 89.6. The metal contained in zirconia. It is commenly obtained in the form of a black powder, but is also known in the crystalline state, forming highly lustrous blackish-gray laming, having a specific gravity of 4.15. The amorphous metal takes fire when gently heated in the air, but the crystalline variety requires an intense heat for its ignition. The common acids do not attack it. Zirconium is a remarkable element in that it is very widely and generally diffused in nature, but nowhere, so far as is known, found in any one locality in large quantity; in this respect it has a decided resemblance to titanium. The form in which it occurs is that of the silicate (zircon), and usually in minute or even microscopic crystals, which have been detected in many granitic and syenitic rocks, as well as in various gneisses and crystalline schists. Zircon has been found also, but less abundantly, in some eruptive rocks, both ancient and modern. Zirconium is chemically most closely related to titanium, and both these metals have certain affinities with silicon, forming dioxids and volatile tetrachlorids, as does that non-metallic element. zirconium (zer-kō'ni-um), n.

Ziziphora (zī-zif'ō-rā), n. [NL. (Linnœus, 1753).] A genus of gamopetalous plants, of the order Labiatæ and tribe Monardeæ. It is characterized by a tubular thirteen-nerved two-lipped calyx, with the throat villous within, and commonly closed after flowering by connivent teeth. There are about 12 species, natives of eastern and central Asia and of southern parts of the Mediterranean region. They are low annuals or spreading undershrubs, usually hoary with close hairs, and bearing small leaves which are nearly or quite entire. The flowers form small axillary clusters, commonly crowded upon the upper part of the stem.

It is characterized by thorny branches, triplenerved leaves, and cynose flowers each with five petals, and by a usually two-celled ovary immeracd in the disk, and bearing two or three conical divergent styles. There are 65 species, natives chiefly of tropical Asia and America, occurring rarely in Africa and Australia. They are shrubs or trees, often decumbent or samentose, commonly covered with hooked spines. The leaves are alternate, coriaccous, entire or crenate, three-to five-uerved, and mostly arranged in two ranks. One or both of the stipules are spinescent, often ending in a hook. The small greenish flowers form short few-flowered axillary cymes. The fruit is a globose or oblong drupe, with a woody or bony stone, containing one to three seeds. The species are known in general as jujube-tree; the name jujube is given especially to the fruit of Z. sativa (Z. vulgaris), of the Mediteranean region, which is there commonly eaten fresh, or used as a cough remedy when dried. Z. Jujuba, of India and China, also furnishes an excellent fruit, enlitivated in numerous forms by the Chinese; a variety is known as the Chinese date. The true jujube does not now usually enter into the confection known as jujube-paste, but is commonly replaced by gum arabic or gelatin. Z. Lotus, the sadr, is one of the reputed sources of the classical lotus-food. (See lotus-tree, 1, and lote-tree.) Many other species hear edible fruit, as Z. Baclei, of Africa, which is there made into bread and into a pleasant beverage; several are valued for ornament on account of their foliage, or for hedges on account of their spines, especially Z. sativa, and also Z. Spina-Christi, one of the 'frist's-thorns (for which see nebluk-tree). Z. nummularia, of Persia and timber-tree of Jamaica, there known as coy-wood. Z. Parryid occurs in southern California and Cerros Island; two former species of Florida, Z. enarginatus, or black ironwood, and Z. Domingensis, or n

(De Blainville, 1830), ⟨ Gr. ζφον, animal (see zoön), + ἀνθος, flower, + -aria.] A division (order or snbelass) of Actinozoa, containing the hexamerous or hexaeoralline forms; the helianthoid polyps, or animal-flowers, contrasted with the Alcyonaria, and characterized by the normal disposition of their soft parts in sixes, or multiples of six (not in eights, as in the Alcyonaria or Octocoralla), and by the possession of simple (not fringed) and usually numerous tentacles: so called from the resemblance of some of them, as the sea-anemones, to flowof some of them, as the sea-anemones, to now-ers. The Zoantharia correspond to the Hezacoralla or Coralligena, and were divided by Milne-Edwards into three suborders (or orders): Malacodermata, with the corallum absent or rudimentary, as in sea-anemones; Sclerobasica, with external non-calcareous corallum, as the black corals of the family Antipathidæ; and Selerodermata, with in-ternal calcareous corallum, as the ordinary hard corals, or stone-corals. Zoanthidæ (zō-an'thi-dē), n. pl. [NL. (J. E. Gray, 1840), < Zoanthus + -idæ.] A family of zoantharian or hexacoralline actinozoans, typizoantharian or hexaeoralline actinozoans, typified by the genns Zoanthus. They are sea anemones in which the individual polyps are ordinarily united by a common creeping stolon, or connective econosarc; they multiply by buds which remain thus adherent. They have no true corallum, but a pseudo-skeleton of hard particles or spicules embedded in the ectoderm; the mesenteric septa are numerous, and of two sorts (one small and sterile, the other large and perfect and furnished with reproductive organs), generally alternating. Like most other sea-anemones, these are fixed organisms, incapable of locomotion; and they include all the colonial forms. Also Zoanthez.

It. zodiaco, < L. zodiacus, the zodiac (L. orbis signifer), also adj., of the zodiac, < Gr. ζωδιακός, the zodiac, prop. adj., 'of animals,' se. κικλος, also called ὁ κικλος ὁ τῶν ζωδίων, or ὁ τῶν ζωδίων κίκλος, 'the circle of animals' (also ἡ ζωδιακή, se. δός, way), the ref. being to the constellations figured as animals; ⟨ ζωδιον, dim. of ζωρι, animal: see zoön.] 1. A being to the constellations figured as animals; $\langle \zeta \phi tov$, dim. of $\zeta \phi ov$, animal: see zoon.] 1. A belt of twelve constellations, extending about 8° on each side of the ecliptic. The constellations are τ , Aries; \star , Taurus; Π , Gemln!; \circlearrowleft , Cancer; \mathfrak{g} , Leo; \mathfrak{m} , Virgo; \hookrightarrow , Lihra; \mathfrak{m} , Scorplo; t, Sagittarius; \mathfrak{m} , Caprleornus; \mathfrak{m} , Aquarius; \mathfrak{m} , Pisces. The zodiac is also divided into twelve equal parta called signs, named after these constellations, and the first point of the sign Aries begins at the vernal equinox. The above symbols refer to the signa. The signa have been carried back by the precession of the equinoxes until they are now 25° behind the corresponding constellations on the average. But the position of the vernal equinox was originally, no doubt, between Aries and Taurus. There is alrong evidence that the zodiac was formed at Babylon about 2100 g. c. There is a poetical description of the heavens written hy Aratus in Macedonia in latitude about 41°, and about 270 g. c. But the appearances described were never to be seen in that latitude, nor in any latitude in that age. Thus, he mentions that the head of the Dragon—that is, Etamin (y Draconis)—and the waist of Cephens—that is, Fleares (3 Cephel)—are on the circle of perpetual apparition. Now, this was true only in the latitude of Babylon, 22\frac{1}{2}° N., about 2200 B. c. He also describes pretty carefully the most southerly stars acen, mentioning the star now called the Peacock's eye (a Pavonis), as well as Canopus (a Argus), but saying that there are no bright stars between the latter and Cetus, so that a Phonicis must have heen invisible. Now these descriptions will suit only a station of latitude 32° N. to 35° N., and an epoch between 1500 B. C. and 2200 B. C. Aratus also describes the courses of the tropics among the stars. That of the tropic of Cancer beat agrees with 2200 B. c., that of the tropic of Cancer beat agrees with 2200 B. c., that of the tropic of Cancer beat agrees with 2200 B. c., that of $\langle \zeta \phi \delta i \sigma v$, dim. of $\zeta \phi \sigma v$, animal: see zoon.] 1. A belt of twelve constellations, extending about

Virgo, Capricornus, Sagittarlus, Centaurus, and Ophluchus; one (Cepheua) has a barbarlan name; and nearly all may be explained from Babylonian mythology. Two at least of the symbols for signa, those of Gemini and Scorpio, much resemble the Babylonian ideographs for the corresponding months. Yet the origin of the Bears, Auriga, Pegasus, Lyra, and Corona was probably not Babylonian. Moreover, certain subjects of common Babylonian fable, such as the tree of life, are not found among the constellations. It is noticeable that it was about 2300 B. C. that He and Ho are said to have reformed the Chinese calendar and divided the heavens into seasons; but the attempt to connect our constellations with the Chinese asterisms has conspicuously failed. The figures of the Chinese zodiac are Tiger, Rabbit, Dragon, Serpent, Horse, Ram, Ape, Cock, Dog, Pig, Rat, Bull. The zodiac was marked out by the ancients as distinct from the rest of the heavens because the apparent places of the sun, moon, and the planets known to them were always within it. This, however, does not hold good of all the newly discovered planetodis. See cuts under constellations named.

It was used in ancient India, in China, and in Arabia, with only minor variations in the star-groups selected. Its place of origin is uncertain and disputed.—Zodiae ring, a ring decorated with one of the signs of the zodiae, either as the sign under which the possessor was born, or perhaps the sign influencing a certain part of the body.

Zodiacal (zō-dī'a-kal), a. [<zodiae +-al.] Of or pertaining to the zodiae: as, the zodiacal signs; zodiaeal planets.—Zodiaeal light, a luminous tract of the aky, of an elongated triangular figure, lying nearly in the ecliptic, its base being on the horizon, and its apex at varying altitudes, seen at certain seasons of the year either in the west after sunset or in the east before sunrise. It appears with greatest brilliance within the troples, where it sometimes rivals the Milky Way. Its nature is unknown; the most plausible hypothesis, supported by many of the most eminent modern astronomera, is that it is the glow from a cloud of meteoric matter revolving round the sun.—Zodiaeal parallel. 3. Specifically, in geog., one of five arbitrary divisions of the earth's surface, bounded by lines parallel to the equator, each named ac lines parallel to the equator, each named according to its prevailing temperature; a climatic belt. These climatic zones are (a) the torrid zone, extending from tropic to tropic, or 23\frac{1}{2}\sigma\$ north and 23\frac{1}{2}\sigma\$ south of the equator; (b) two temperate zones, extending from the tropics to the polar circles—that is, from the parallel of 23\frac{1}{2}\sigma\$ north or about to that of 66\frac{1}{2}\sigma\$ north or south, and therefore called the north temperate and south temperate zones, and (c) two frigid zones, extending from the polar circles to the north and south poles respectively.

4. Any continuous tract or belt differing in allowester from adjoining tracts; a definite area

character from adjoining tracts; a definite area or region within which some distinguishing circumstances exist or are established: as, the zones of natural history, distinguished by speeial forms of vegetable or animal life; a zone of free trade; a free zone on the border of a country free trade; a free zone on the border of a country or between adjoining states. Naturalists formerly divided the sea-bottom into five zones in accordance with the depth of water covering each, which was supposed to determine its fauna and flora. They were called respectively littoral, circumlittoral, median, inframedian, and abussal. Later researches have proved that the assumed facts were to a great extent croneous, organisms supposed to be confined to the littoral zone having been found at the greatest depths. In geology zone has nearly the same meaning as horizon. A stratum, or a group of strata, may be characterized by the presence of a certain assemblage of fossils, or by one particular fossil; in such cases the most abundant or typical fossil may give a name to the subdivision in which it occurs, which will then be designated as the zone of that particular species. Thus, the Lower and the Middle Lias have together been divided into twelve zones, each characterized by the presence of a certain species of summonite: as, the "zone of the Arietites (Ammonites) raricostatus," etc.

zoniferous (zō-nif'e-rus), a. [〈 L. zona, zone, + ferre = E. bear!.] Having or bearing a zone: zoned.

Zonites (zō-nī'tēz), n. [NL. (Montfort, 1810). ⟨ Gr. ζωνίτης, girded, ⟨ ζώνη, girdle: see zone.] In eoneh.. a genus of pulmonate gastropods, referred to the family Helieidæ, or to the Limacidæ. or to the Vitrinida, and giving name to the Zonior to the latinuida, and giving name to the Zonitina. The species are numerous, as Z. cellaria (see cellarismi). Z. milium is a very small species of the United States; Z. umbilicata is known as the open smail. The genua in a broad sense includes species of Hyalina and related forma; but it is also restricted to about a dozen species of the Mediterranean region, as Z. algirus.

Zonitidæ (zō-nit'i-dē), n. pl. [NL., < Zonites + -idæ.] A family of terrestrial gastropods, typi-

fied by the genus Zonites: same as Vitrinidæ. Trans. New Zealand Inst., 1883.

Zonitinæ (zō-ni-tī'nē), n. pl. [NL., < Zonites + inæ.] A subfamily of *Vitrinidæ* or another family, typified by the genus *Zonites*, and including forms with a helicoid shell (into which the animal can completely withdraw) and with

lateral bicuspid and marginal acute teeth.

Zonitis (το-ni'tis), n. [NL. (Fabricius, 1775), ζ

This is an important branch of zoology, of much intrinsic interest in several respects, and of special significance in its hearing upon the questions of the origin of species and their modification under climatic and other physical conditions of environment. It has been much studied of late years with the result of mapping the land-surface of the globe into several major and numerous minor areas, which can be bounded and graphically represented in colors with almost the precision stained in depicting civil or political boundaries. Zoogeography is related to paleontology as the distribution of animals in space is related to their succession in time; but the principles of zoögeography are of course as applicable to any former as to the present dispersion of species on the face of the globe. See province, 0, and region, 7.

Zoöglæa (zō-ō-glō'ā), n.; pl. zoöglææ (-ō). [NL., Gr. ζφον, animal, + γλοιός, a sticky substance.] 1. A peculiar colony of Schizemycetes in which they form a jelly-like mass by the swelling up of their cell-membranes. It was formerly recorded as a distinct game, but he was known to be the surface of the globe; faunal or faunistic

ing up of their cell-membranes. It was formerly regarded as a distinct genus, but is now known to be a kind of resting stage in which the various chements are glued together by their greatly swellen and diffluent cell-walls becoming contiguous. It corresponds to the palmella stage of certain of the lower algae,

Bacteria sometimes form a jelly-like mass by the swelling up of their cell-membranes; this is the zoogleea stage.

Bessey, Botany, p. 212.

A massing together of micro-organisms which occurs in a certain stage of their development, the collection being surrounded by a gelatinoid envelop.

Liquids in which any of these Schizomycetes are actively developing themselves usually bear on their surface a gelatinous seum, which is termed by Prof. Cohn the Zoöglæa.

See II. and motion.

II. n. In biol., something like an animal; that which is of the nature of an animal, yet is not an animal in an ordinary sense, and is not the whole of an animal in a strict sense; one of the "persons" or recognizably distinct entities which appropriate your that product of tities which compose a zoon; that product of any organism, whether of animal, vegetable, or equivocal character, which is capable of spontaneous movements, and hence may have an existence more or less apart from or indepentaneous movements, and hence may have an existence more or less apart from or independent of the parent organism. The biological conception of a zooid is a fundamental one, bordering upon an almost metaphysical definition of what may constitute individual identity or non-Identity in a given case: the term covers a multitude of cases which seem at first sight to have little in common, and its use in ordinary zoology and botany is consequently various. The general sense of the word is subject to the following specifications: (a) An ambiguous or equivocal organic body intermediate between a plant and an animal, and not distinctly either one or the other; a micro-organism or microbe not amenable to ordinary classification in natural history, as bacteria, bacilli, and micro-occi; a protistan, as a moner; one of the lowest protozoans; a protophyte. Such zooids are microscopic, and for the most part of extreme minuteness. See the distinctive names, and Monera, Primalia, Protista, Protophyta, Protozoa. (b) One of certain peculiar cells of multicellular animals and plants which are endowed with special activities, have as it were an individuality of their own and are capable of a sort of separate existence. Zooids of this class are mainly germinal or reproductive. The Jennale germ (ovum) and the corresponding male element are respectively types of the whole. They occur under many modifications, which receive distinctive names; many of the smallest and simplest forms are indifferently known as sporce. See spore?, sporeformation, ospore, zoospore, sporozobid, antherozoid, spermatozoöid, and sper-

matesseon, with various cuts. The foregoing definitions are independent of any distinction to be drawn between plants and animals; the following are zoological. (? Of or pertaining to zoölogy.—Zoòlogical garden, a park or other large inclosure in which live animals are kept for public exhibition.—Zoölogical province, region, etc., in zoögeog, one of the faunal areas, varying in extent, into which the land-surface of the globe is naturally divisible with reference to the geographical distribution of animals. (See province, 6, region, 7, and zoögeography.) Corresponding divisions of the waters of the globe may take the same name when their surface-extent is considered, or are distinctively named (see Arctalia, etc.). Zoölogical areas regarded vertically, or as to depth of water, are often called zones or betts. See zone, n., 4.

or botany) as one of the two main branches of biology. The connectation which the term has acquired during the last fifty years is very extensive, as a result of the application to zoological science of the most general laws and principles of biology. So far is zoology freed from the former restriction of its scope to the mere formalities of description, classification, and nomenclature (which constitute only systematic zoology) that it now includes the results of all the biological sciences in so far as these are applicable to the study of animal structure and function. Such are phylogeny, or the origination of species, genera, etc.; ordegeny, or the origination of the individual animal; embryology, or the prenatal life-history of originals; potentially or pedeoxology, the history of originals; potentially or pedeoxology, the history of originals; potentially or pedeoxology, the history of originals; potentially or pedeoxology, the science of animal instances and tissue; zoopenhology, the science. The name zoology is an old one, and some of its branches have been cultivated from antiquity, one of the earliest classifications of animals in which a modern zoological group can be clearly recognized is that ascribed to Moses, which was based primarily upon certain hygicale and saccredual considerations; for the clean beach of the control of th

evolution as opposed to special creation, and the variability of organisms by their appetency, as opposed to their fixity in character. Lamarck recognized the two Aristotelian main branches as Vertebrata and Invertebrata, the former with 4, the latter with 12 classes, and both with many ordinal and lower groups. Cuvier was profoundly versed in comparative anatomy, gave also special prominence to paleontology, and reached the conclusion (1812) that all animals are modeled upon four types, for which he adopted the names Vertebrata, with 4 classes; Mollusca, 6 classes; Articulata, 4 classes; Radiata, 5 classes; —each with more or fewer orders. Except the first of these (borrowed from Lamarck and so from Aristotle), none of these "types" are found to hold; and few of the classes or ordera are now accepted as framed by Cuvier, whose views and methods in the main were upheld in England by Owen. Cuvier's system was completed in 1829. Among the last notable views of classification before the appearance of Darwinism are those of Leuckart (1848), giving 5 types and 14 classes of invertebrates (without the protozosms); of H. Milme-Edwards (1855); and of L. Agassiz (1859). The period between Lamarck and Darwin was one of extraordinary activity in all branches of zoological investigation, involving the accumulation of a wealth of material, the description of thousands of new genera and species, and the multiplication of distinctions founded upon little difference; but philosophical generalizations did not keep pace with the elaboration of analytical details. Zoological systems in various departments became almost as numerous as the specialists engaged; and the subject acquired a huge literature, descriptive, (conographic, and classificatory, as well as controversial. This aspect of zoology has continued during the past thirty years or so (1859-91); but the real history of the zoology of this period is the history of Darwinian evolution, or the application of general principles of individual development (ontogeny) to the sol underlying principle.

2. Zoögraphy; the written description of an-

underlying principle.

2. Zoögraphy; the written description of animals; a treatise on animals, especially a systematic treatise, or zoölogical system. Several of the main classificatory divisions of the animal kingdom represent formally named departments of systematic zoology. Such are mammalogy or mastology or therology, the formal science of mammals; ornthology, of birds; herpetology, of reptiles, including amphibians; ichthyology, of fishes in their several classes; conchology or malacology, of mollusks; carcinology or crustaceatogy, of crustaceans; entomology, of insects (more extensive than all the others combined); helminthology, of worms; and zoöphytology, of zoophytes. From some of these again subdivisions are formed, in consequence either of the intrinsic limportance of certain of their subjects or of the special activity of investigation of these subjects — as, for example, anthropology (including ethnography and sociology), or the particular study of man from a biological standpoint; cetology, the study of whales as differing much from ordinary manimals; selachology, of one of the classes of fishes; ascidiology, of the connecting links between invertebrates and ordinary vertebrates; and especially of bacteriology, the lately created science of microbes or micro-organisms, which probably of slit the departments of zoology has the most direct and important bearing upon human welfare and happiness.

zoōmorphic (zō-ō-môr'fik), a. [\langle Gr. ζφον, animal, + μορφή, form.] 1. Representative of animals, or of their characteristic forms, as of animals, or of their characteristic torms, as work of art; of or pertaining to zoömorphism: eorrelated with authropomorphie.—2. Especially, representing or symbolizing the eoneeption of a god under the form of an animal whose characteristic traits or habits sugman whose enaracteristic traits of habits suggest the idea attached to the god. The most thoroughly zoomorphic religion was probably that of the ancient Egyptians, resulting in a complex system of zoolarty, many elements of which were appropriated and adapted by the Greeks and Romans.

Under Dynasty XII. the gods that had previously been represented in art as beasts appear in their later shapes, often half anthropomorphic half zoomorphic, dog-headed, cat-headed, hawk-headed, bull-headed men snd women.

zoömorphism (zō-ō-môr'fizm), n. [\(zoömorph-ic + -ism. \)] 1. The character of being zoömorphie; zoömorphie state or condition; representation or exhibition of animal forms as distinguished from the human form; especially, the characterization or symbolization of a god in animal form. Compare anthropomorphism.— 2. The conception or representation of men or supernal beings under the form of animals, or of men or gods transformed into beasts; the attribution of human or divine qualities to beings of animal form; worship of the images of animals; zoötheism.

Zoomorphism is much more absurd than Anthropomorphism after all. Surely the rational mode is to employ the highest conceptions you can, while freely acknowledging their utter inadequacy.

[NL., \langle Gr. ζω̄νν, an animal; cf. ζω̄ν, life; \langle ζάειν, ζῆν, lonie ζω̄ειν, live.] An animal form containing all the elements of a typical organism of the group to which it belongs; a morphological individual regarded as the whole product of an impreg-nated ovum, which may or may not be divided into persons or zoöids without true generation.

See zooid.

It is nrged that whether the development of the Iertilized germ be continuous or discontinuous is a matter of secondary importance; that the totality of living tissue to which the Iertilized germ gives rise in any one case, is the equivalent of the totality to which it gives rise in any other case, and that we must recognize this equivalence, whether such totality of living tissue takes a concrete or a discrete arrangement. In pursuance of this view a zoological individual is constituted either by any such single animal as a manmal or bird, which may properly claim the title of a zoon, or by any such group of animals as the numerous Meduse that have been developed from the same egg, which are to be severally distinguished as zoolds.

Zoöphyta (zō-of'i-tā), n. pl. [NL., pl. of zoöphyton: see zoöphyte.] The alternative name of the Cuvierian Radiata; the Phytozoa; the animal-plants, or plant-like animals. In later systems, especially following the classification of Cuvier, the name has been much used for a large artificial and beterogeneous assemblage of the lower invertebrates, many of which, like pecially following the classification of Cuvier, the name has been much used for a large artificial and heterogeneous assemblage of the lower invertebrates, many of which, like the corallines, have a plant-like habit, and branch from a fixed base. It thus covers, or has covered, all the true celenterates (actinozoans, hydrozoans, and etenophorans), all the echinoderms (starfishes, sea-urchins, holothurians, and erinoids), the polyzoans, the sponges, some of the worms which used to be classed as radiates, and all the infusorians and other protozoans known, having thus no better standing than "the radiate mob" of Cuvier. (See Radiata, 1.) In some of its various restricted applications, however, it has excluded certain forms that obviously belonged elsewhere, and the tendency has been to adapt the name to the coelenterates, with or without the sponges. Quite recently the proposition has been made, and by some accepted, to use the name in this strict sense, and instead of Calentera or Calenterata; in which case it would cover the Actinozoa, Hudrozoa, Clenophora, and Spongiæ. The New Latin form of the term is attributed to Wotton (1492–1555), who in his "De Differentiis Animalium" (Paris, 1552) included under this name practically its present content: namely, holothurians, starfishes, jellytshes, sea anemones, and sponges.

Zoöphyte (zō ō-fīt), n. [⟨NL. zoöphyton, ⟨Gr. ζωφψνον (Aristotle), lit. 'animal-plant.' ⟨ζων, animal, + φντόν, plant.] A member of the Zoöphytot, in any sense; a radiate; a phytozoan.

The term is a loose popular equivalent of the technical designation; but it is convenient, and may be employed for any of the Zoöphyta in a proper sense, as corals, sea-anemones, acalephs, and sponges. The chief objection to its use is its continued application to those polyzoans which are of coralline aspect, as these have no affinity with coelenterates.—Glass-rope zoöphytest, the glass-rope sponges, or Hyatonemidae (which see).

zoöphyte-trough (zo´ō-fit-tròf), n. A device for retaining living zoöphytes or infusoria which are to be examined under the microscope. It consists of a frame with two movable sides

which are to be examined inder the interescope. It consists of a frame with two movable sides of glass, and a false bottom, also of glass, small enough to admit of the insertion of the sides between it and the frame. The upper edges of the sides are pressed together by a spring, and can be separated as desired by a wedge. E. H. Kraight.

Zygæna (zī-jē'nä), n. [NL. (Fabricius, 1775), ⟨Gr. ζύγαινα, supposed to mean the hammer-headed shark.] I. In entom., a genus of moths, typical of the family Zygænidæ, the species of which are known as burnet-moths, as Z. minos, which are known as burnet-moths, as Z. minos, the transparent burnet; Z. trifolii, the five-spotted burnet; Z. lonicera, the narrow-bordered burnet; Z. filipendulæ, the six-spotted burnet; tet. It was at first coextensive with the family, but now includes only those forms that have the antenme claviform, a little longer than the body; the wings elongate, and spotted; the palpi short, hairy, and acute; and the larve contracted, stout, hairy, and transforming in a fusiform parchment-like cocoon. Nearly 100 species are known, of which 52 occur in Europe, the others in Asia and Africa; 26 are British. The larvæ are remarkable in hibernating in the haif-grown condition. Some endomologists change the name to Anthrocera, because it is the same as the genus Zygæna in ichthyology; but this is a mistake, for entomology has the prior claim upon the named Zygæna.

The family comprises a more or less definite and characteristic series of moths intermediate between the Bombyeidæ and the Castniidæ. By most modern authors a section tic series of moths intermediate between the Bombyeidæ and the Castinidæ. By most modern authors a section of the old family Zygenidæ is separated into a family Agaristidæ. The Zygenidæ proper have pectinate antennæ, rather narrow wings rounded at the tip, and a venation similar to the arctians. Their larvæ are short, hairy, and transform in cocoons composed entirely of silk or mainly of hair. The European forms belong mainly to Zygena, while the principal American genera are Proeris, Harrisina, Ctenucha, Lycomorpha, and Glaucopis, the latter containing more than 100 South American species. Euchromá is another large genus, comprising more than 150 species, mainly South American. See cut under Procris. zygapophysial (zi-gap-ō-fiz'i-al), a. [⟨ zyga-pophysis + -al.] Of or pertaining to a zyga-pophysis; articular, as a vertebral process. zygapophysis (zī-ga-pof'i-sis), u.; pl. zyga-pophyses (-sēz). [NL., ⟨ Gr. ζυγόν, yoke, + απόφυσις, process: see apophysis.] A process upon the neural arch of a vertebra corresponding to the test colled abligue or articular in hy ing to that called oblique or articular in hu-man anatomy, provided with a faeet for ar-ticulation with the same process of a preeeding or succeeding vertebra, thus serving to interor succeeding vertebra, thus serving to inter-lock the series of vertebral arches. There are normally two pairs of zygapophyses to a vertebra, the two processes (right and left) which are situated upon the an-terior border of any arch being called prezygapophyses, and those upon the posterior border, postzygapophyses. Each pair of any one vertebra articulates with the other pair of the next vertebra. As an ordinal group, it contains the ormers or sea-ears, the pleurotomariolds, the keyhole-limpets, and the true limpets, and is divided into Ctendiobranchiata and Phyllidiobranchiata (the latter being the Patellidæ alone). Also called Zeugobranchia, Zygobranchia. See cuts under abadene, Fissurellidæ, Patella, patelliform, Pleurotomaria, Pleurotomaridæ, and sea-ear.

zygobranchiate (zī-gō-brang'ki-āt), a. and n. [⟨ NL. *zygobranchiatus, ⟨ Gr. ζυγόν, yoke, +βράγχια, gills: see branchiate.] I. a. Having paired and as it were yoked gills or ctenidia, as acetain melluciate having the second of the second o certain mollusks; having the characters of or pertaining to the Zygobranchiata; zygobranch.

II. n. Any member of the Zygobranchiata.
zygocardiac (zī-gō-kār'di-ak), a. [⟨ Gr. ζνγόν, yoke, + καρδία = Ε. heart: see eardiac.] Noting a certain hard protuberance of the stomach of a erustacean, formed by a thickening of the ehitinous lining of the cardiac division (in the crawfish an elongated posterolateral ossiele, eonnected with the lower end of the antero-lateral ossicle, and passing upward and backward to become continuous with the pyloric ossiele): eorrelated with pterocardiac and uroeardiac

Zygodactyla (zī-gō-dak'ti-lā), n. pl. [NL. (Brandt, 1835), fem. of *zygodactylus: see zygodactylus: se dactylous.] 1. Agenus of acalephs, of the family Equoreidæ. It includes some large jellyfishes, 6 or 8 inches in diameter, with long violet streamers, found in the north Atlantic waters.

2. A section of pachydermatous mammals, corresponding to the *Suidæ* in a broad sense; the swine. The name implied the cloven hoof of these animals, in distinction from the solidungulate or multun-gulate hoof of the quadrupeds with which swine were formerly classed as Pachydermata. See Artiodactyla (with cut).

Zygodactylæ (zī-gō-dak'ti-lē), n. pl. [NL.: see Zygodactyla.] A group of arboricole nou-passerine birds whose toes are yoked in pairs, two before and two behind: synonymous with Scanbefore and two behind: synonymous with Scansores (which see). The group is artificial, being framed with reference to the single character expressed in the name, insistence upon which brings together some birds which belong to different orders, as Psittaci and Picariæ, separates the picarian families which are not yoke-toed from their near relatives which are yoke-toed, and ignores the exceptional zygodactylism of the trogons. Various attempts—as by Blyth (1849), Sundevall (1872), and Schater (1880)—to restrict the name to a part of the birds it originally designated, and retain it in the system in a stricter sense, have not been entirely snecessful. zygolabialis (zī-gō-lā-bi-ā'lis), n.; pl. zygolabiales (-lēz). [NL., \(\sigma\); \(zygo(ma) + labialis, labial.] The lesser zygomatic muscle; the zygomaticus minor. Coues, 1887. See first ent under muscle1.

zygoma (zī-gō'mā), n.; pl. zygomata (-ma-tā). [NL., ζ Gr. ζίγωμα, the zygomatic arch, also a yoke, bolt, bar, ζ ζυγοῦν, yoke, join, ζ ζυγοῦν, a yoke, joining: see yoke¹.] 1. The bony arch or arcade of the cheek, formed by the malar or jugal bone and its connections: so called because it serves to connect bones of the face with those of the skull about the ear. In mammals, including man, the zygoma consists of a malar bone connected behind with the squamosal bone, usually by a zygomatle process of the latter, and abutting in front against a protuberance of the superior maxillary bone, or of the frontal or the lacrymal bone, or any of these. It is usually a stout

Skull of Mylodon, a gigantic extinct sloth, showing the massive zygoma x, with strong superior and inferior processes a, a'. (Great ly reduced.)

bony arch, sometimes with a strong descending process, giving principal origin to a masseter muscle, and bridging over the temporal muscle. It is sometimes a slender red, and may be imperfect, as in shrews. The part taken in its formation by the malar bone is very variable in extent. (See cut under skull.) Below mammals the construction of the zygoma posteriorly is entirely altered. In birds the arch is articulated there with the quadrate bone, or suspensorium of the lower jaw, representing the malleus of a mammal, and an additional bone, the quadratopugal, intervenes between the quadrate and the malar proper. In such cases the anterior connection is more particularly with the maxillary bone, or with this and the lacrymal, and the zygoma is generally a slender rod-like structure. (See cut under Galling.) In reptiles further modifications occur, such as the completion of the arch behind by nnion of the jugal bone with the postfrontal and squamosal; or there may be no trace of a structure to which the term zygoma is properly applicable, as in the Ophidia, in which there is no jugal or quadratojugal bone. Annong batrachians, as the frog, a zygomatic arch is represented by the connection of the maxillary bone, by means of a quadratofyngal bone, with a bone called temporomastoid (see cuts there and under Anura). In any case a zygoma consists of a suborbital or postorbital series of ossifications in membrane, or membrane-bones, developed on the outer side of the maxillary series of the embryo (the same that gives rise to the pterygopalatine bar), and when best differentiated is represented by lacrymal, maxillary, jugal, and quadratojngal bones; and its connection with the sphenoid, as occurs in man, is quite exceptional.

Zygonectes (zi-go-nek'tez), n. [NL. (Agassiz,

1834), so called because said to swim in pairs; ((r. ζυγόν, yoke, + νήκτης, swimmer.] A large genus of small earnivorous American cyprinogenus of small earnivorous American cyprino-donts; the top-minnows. They are closely related to the killifishes (Fundulus), the technical difference be-lag chiefly in the smallness and backwardness of the dor-sal fin, which has usually less than ten rays and is com-monly inserted behind the front of the anal fin. The top-minnows are on the average smaller than the killi-fishes, being usually only 2 or 3 inches long. They are surface swimmers, and feed on insects. The species are numerous, and individuals abundant. One of the best-known is Z. notatus, common in ponds from Michigan to Alabama and Texas.

Zygopetalum (zī-gō-pet'a-lum), n. [NL. (Hooker, 1827), so called with ref. to the union of the perianth with the foot of the column; \langle Gr. $\zeta v_j \delta v$, yoke, $+ \pi \epsilon \tau a \lambda o v$, leaf (petal).] A genus of epiphytic orchids, of the tribe *Vaudew* and of epiphytic orchids, of the tribe Vaudew and subtribe Vyrtopodiew. It is characterized by showy solitary or loosely racemed flowers with spreading sepals, the lateral ones united to the short foot of the incurved column; by a flattish lip, bearing a transverse creat at its base; and by an anther with four obvoid pollen-masses, attached by a rather broad stalk or gland. There are about 50 species, natives of tropical America from the West Indies and Mexico to Brazil. They are handsome plants with short leafy stems finally thickened into pseudobulbs. Their leaves are two-ranked, membranous or somewhat rigid, and slightly plicate or with elevated veins. They are highly prized in cultivation under glass, especially Z. Mackoii, the original species.

 a. Zygophyceæ (zī-gō-fis'ē-ē), n. pl. [NL., < Gr. he ζυγόν, yoke, + φῦκος, seaweed, + -eæ.] A group or order of unicellular or multicellular fresh- water algae, not now generally accepted, with the cells single, or segregate, or geminate, or united in a series. Multiplication is effected by division in one direction, and by means of zygospores resulting from the conjugation of the cells. It embraces the families Desmidiaceæ, Zygonaceæ, etc.

Zygophylleæ (zī-gō-fil'ō-ō), n. pl. [NL. (R. Brown, 1814), 〈 Zygophyll-um + -eæ.] An order of polypetalous plants, the bean-caper family, belonging to the series Discifloræ and the coof polypetalous plants, the bean-eaper family, belonging to the series Discifloræ and the cohort Geraniales. It is characterized by flowers which usually bear a fleshy disk, five free glandless sepals, fliaments augmented each by a small scale, and a jurrowed angled or lobed ovary with two or more fillform ovules in each of the four or five cells. It includes about 110 species, classed in 18 genera, natives of tropical and warm climates, especially north of the equator. They are commonly shrubs or herbs with a woody base, bearing divaricate branches jointed at their nedes. Their leaves are usually opposite and pinnate or composed of two entire leaflets; the twin persistent stipules are sometimes developed into spines. The flowers are white, red, or yellow, very rarely blue, usually solitary in the axils of the stipules. The principal genera are Zyyophyllum (the type). Tributus, Guaiacum, and Fagonia; 10 genera are monotypic; two species of Guaiacum (lignum-vitæ) hecome mederate trees. The woody species are remarkable for the extreme hardness of their wood, and several, as Guaiacum, produce a bitter and aerid bark. Their detersive foliage is used in the West Indies to seour floors. Some of the family are so abundant in the Egyptian desert as to constitute a characteristic feature of its vegetation.

Zygophyllum (zī-gō-fil'um), n. [NL. (Linnæus, 1737), ⟨ Gr. ζυγόν, yoke, + φίλλον, leaf.] A genus of plants, type of the order Zygophyllæe. It is characterized by opposite bifoliciate leaves, flowers with four or five petals, and a sessile ovary with the evules fixed upon the axis. There are about 60 species, natives of the Old World and of Australia. They are diminutive shrubs, often prestrate, and with spinescent branches. The leaves are opposite, usually composed of two fleshy leaflets armed at the base with spines which represent stipules. The flowers are white or yellow, usually marked mear the base with a purple or red spet. Z. Fabago is the bean-caper of the Levant; its flower-buds are used as capers. The arom

zymogen (zi'mō-jen), n. [⟨ Gr. ζύμη, leaven, +-γενής, producing.] A substance from which an enzym may be formed by internal change.

Also zymogene.

A ferment is found to exist as a zymogen in the resting seed, which is readily developed by warmth and weak acids into an active condition.

Nature, XLI. 380.

zymogenic (zī-mō-jeu'ik), a. [As zymogen + -ic.] Exciting fermentation: as, zymogenic organisms.

zymogenous (zī-moj'e-nus), a. [As zymogen +

-ous.] Same as zymogenic. zymoid (zi'moid), α. [⟨ Gr. *ζνμοείδης, ζνμώδης, like leaven, ⟨ ζίμη, leaven, + είδος, form.] Re-

zumologist.

zymology (zī-mol'ō-ji), n. [Also zumology; < (ir. ζυμη, leaven, + -λογία, < λέγειν, speak: see -ology.] The science of or knowledge concerning fermentation.

ng termentation.

zymolysis (zī-mol'i-sis), n. [$\langle Gr. \zeta \nu \mu \eta$, leaven, + $\rangle \delta \sigma a c$, dissolving.] Same as $z \gamma mosis$, 1.

zymolytic (zī-mō-lit'ik), a. [$\langle z \gamma molysis (-lyt-) + -ic$.] Same as $z \gamma motic$.

2ymonheter (21-mom e-ter), m. [ζ Gr. $\zeta v m$, leaven, $+ μ \dot{\epsilon} \tau \rho o v$, measure.] An instrument for ascertaining the degree of fermentation of a fermenting liquor. Also zymosimeter. **2ymophyte** (zī'mō-fīt), n. [ζ Gr. $\zeta \dot{v} \mu \eta$, leaven. $+ \phi v \tau \dot{o} v$, plant.] A bacterioid ferment that

liberates fatty acids from neutral fats. Bil-

zymoscope (zī'mō-skōp), n. [⟨Gr. ζίμη, leaven, + σκοπείν, view.] An instrument, contrived by Zenneck, for testing the fermenting power of yeast, by bringing it in contact with sugarwater and observing the quantity of earbonic anhydrid evolved. Watts.

zymosimeter (zī-mō-sim'e-tèr), n. [\langle Gr. ζi - $\mu \omega \sigma u$, fermentation, + $\mu \acute{e} \tau \rho o \nu$, measure.] Same as zymometer.

2. An infectious or contagious disease.

zymotechnic (zī-mō-tek'nik), a. [\langle Gr. $\zeta i \mu \eta$, leaven, + $\tau \dot{\epsilon} \chi \nu \eta$, art.] Relating to the art of inducing and managing such fermentations as are useful in the arts; pertaining to zymotechnics.

technics.

zymotechnical (zī-mō-tek'ni-kal), a. [⟨zymotechnic + -al.] Same as zymotechnic.

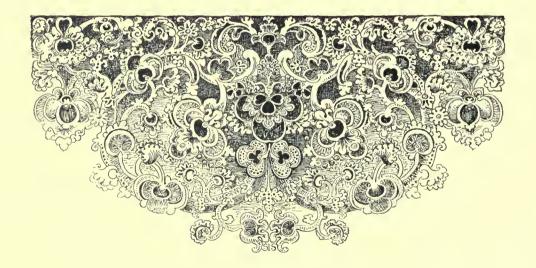

zymotechnics (zī-mō-tek'niks), n. [Pl. of zymotechnic (see -ics).] The art of managing fermentation. Compare zymurgy.

zymotic (zī-mot'ik), a. and n. [⟨Gr. ζνμωτικός, ⟨ζύμωσις, fermentation: see zymosis.] I. a. Pertaining to fermentation; of the nature of fermentation. Also zymolutic. - Zymotic disease.

Pertaining to fermentation; of the nature of fermentation. Also zymolytic.—Zymotic disease, any disease, such as malaria, typhoid fever, or smallpox, the origin and progress of which are due to the multiplication within the hody of a living germ introduced from without.—Zymotic papilloma, frambosia.

II. n. Same as zymotic disease. See I. zymotically (zī-mot'i-kal-i), adv. [⟨zymotic+-al+-ly²-] In a zymotic manner; according to the manner or nature of zymotic diseases. zymurgy (zi'mer-ji), n. [⟨Gr. ζύμη, leaven, + ἐργον, work (cf. metallurgy, etc.).] That department of technological chemistry which treats of the scientific principles of wine-making, brewing, and distilling, and the preparation of yeast and vinegar, in which processes

three abdominal segments vesicular.

LIST OF AMENDED SPELLINGS

RECOMMENDED BY THE PHILOLOGICAL SOCIETY OF LONDON AND THE AMERICAN PHILOLOGICAL ASSOCIATION

THE American Philological Association, giving voice to the general opinion of the most eminent scholars in English philology, as reflected in previous discussions in that body and elsewhere and expressed in the annual reports of a special committee, adopted and published, in 1876, a declaration in favor of a reform in English spelling. That declaration, as printed in the List of Amended Spellings subsequently recommended by the Association, is as follows:

The true and sole office of alfabetic writing is faithfully and intelligibly to represent spoken speech. So-calld "historical" orthografy is only a concession to the weakness of prejudice.

2. The ideal of an alfabet is that every sound should hav its own unvarying sign, and every sign its own unvarying sound.

3. An alfabet intended for use by a vast community need not attempt an exhaustiv analysis of the elements of utterance and a representation of the nicest varieties of articulation; it may well leav room for the unavoidable play of individual and local pronunciation.

4. An ideal alfabet would seek to adopt for its characters forms which should suggest the sounds signified, and of which the resemblances should in sum measure represent the similarities of the sounds. But for general practical use there is no advantage in a system which aims to denict in detail the fysical processes of utterance.

tem which aims to depict in detail the fysical processes of utterance.

5. No language has ever had, or is likely to hav, a perfect alfabet; and in changing and amending the mode of writing of a language airedy long writn regard must necessarily be had to what is practically possibil quite as much as to what is inherently de-

6. To prepare the way for such a change, the first step is to break down, by the combined influence of enlightend scolars and of practical educators, the immense and stubborn prejudice which regards the establisht modes of spelling almost as constituting the language, as having a sacred character, as in themselve preferabl to others. All agitation and all definit proposals of reform ar to be welcumd so far as they work in this direction.

7. An alterd orthografy will be unavoidably offensiv to those who ar first calld upon to uze it; but any sensibl and consistent new system will rapidly win the harty preference of the mass of writers.

8. The Roman alfabet is so widely and firmly establisht in use among the leading civilized nations that it cannot be displaced; in adapting it to improved use for English, the efforts of scolars should be directed towards its use with uniformity, and in conformity with other nations.

In pursuance of this declaration, further action was taken by the Association from year to year; and, a similar declaration having been made by the Philological Society of London, the two bodies agreed, in 1883, upon certain rules (the Twenty-forr Rules) for the correction of the orthography of certain words and classes of words. Subsequently an alphabetical list of the principal words covered by the rules was made. "The corrections are in the interest of etymological and historical truth, and are to be confined to words which the changes do not much disguise from the general reader." The rules are printed in the "Proceedings" of the American Philological Association for 1883. The list was printed in the "Transactions" for 1886, and later in the periodical "Spelling," in October, 1887, from which it is here reprinted, with some slight corrections.

The list is printed here as a record of an important movement which promises to be of special interest to lexicographers in the near future, and as a recognition, in addition to the remarks made in the Preface (p. ix), of the desirableness of correcting the anomalies and redundancies of English spelling in the directions indicated. It is the main office of a dictionary to record actual usage, not to recommend better usage; but in eases of unsettled usage it must adopt, and thus by inference recommend, one form as against the rest; and, in view of the fact that the amended spellings in question have been recommended by the highest philological authorities in the English-speaking world, and that they have been to a considerable extent already adopted, in whole or in part, by many respectable newspapers and other periodieals, and by a large number of persons in private use, besides those who take part in the agitation for spelling reform, they can hardly be ignored in a dictionary which records without wincing the varying orthography of times just past, and of earlier generations. The reformed orthography of the present, made with scientific intent and with a regard for historic and phonetic truth, is more worthy of notice, if a dictionary could discriminate as to worthiness between two sets of facts, than the oftentimes eapricions and ignorant orthography of the past.

It need not be said in this dictionary that the objections brought on etymological and literary and other grounds against the correction of English spelling are the unthinking expressions of ignorance and prejudice. All English etymologists are in favor of the correction of English spelling, both on etymological grounds and on the higher ground of the great service it will render to national education and international intercourse. It may safely be said that no competent scholar who has really examined the question has come, or could come, to a different conclusion; and it may be confidently predicted that future English dictionaries will be able to recognize to the full, as this dictionary has been able in its own usage to recognize in part, the right of the English vocabulary to be rightly spelled.

It is to be noted that many of the corrected spellings in the following list are merely reversions to a simpler mode of spelling formerly common; indeed, such is largely the intent of the list. Examples are engin, genuin, wil, shril, and the like, and especially verbal forms like dropt, kist, mist, tost, etc.— a mode of spelling in use for more than a thousand years (compare Anglo-Saxon cyste, English kist; Anglo-Saxon miste, English mist, etc.), and still familiar in the usage of the best modern poets, as Tennyson and Lowell (leapt, mist, tost are in Lowell's last poem, "My Brook," December, 1890). All considerations, historical, literary, and economical, are in favor of such corrected forms.

W. D. WHITNEY.

In the following list, as in the Twenty-four Rules, many amendahi words hav been omitted for reasons such as these: I. The changed word would not be easily recognized, as nee for knee. 2. Letters ar left in strange positions, as in edg for edge, casq for casque. 3. The word is of frequent use. Final $g=j,\ v,\ q,\ z,$ and syllable l and n, ar strange to our print hut abundant in our speech. Many of them ar in the list: hav, freez, singl, eath, etc.; but iz for is, or for of, and many other words, as we as the final z=s of inflections, ar omitted. 4. The wrong sound is suggested, as in vag for vague, acer for acre. 5. A valuable distinction is lost: casque from cask, dost from dust.

Unuzual words having a familiar change of ending, as -le to -l, and simpl derivative and inflections, ar often omitted. Words doutful in pronunciation or etymology, and words undecided by the Associations, however amendabl, ar omitted. Inflections ar printed in italics.

The so-calld Twenty-four Rules ar many of them lists of words. The rules proper ar as follows:

TEN RULES.

 e.— Drop silent e when fonetically useless (writing -er for -re), as in live (iiv), single (singl), eaten (eatn), rained (raind), etc., theatre (theater), etc.

- 2. ea.— Drop α from $e\alpha$ having the sound of e, as in feather (fether), leather (lether), etc.
- o.— For o having the sound of u in but write u in above (abuv), tongue (tung), and the like.
- ou. Drop o from ou having the sound of u in but in trouble (trub), rough (ruf), and the like; for -our unaccented write -or, as in honour (honor), etc.
- u, ue. Drop silent u after g before a, and in nativ English words, and drop final
 ue: guard (gard), guess (gess), catalogue (catalog), league (leag), etc.
- 6. Dubl consonants may be simplified when fonetically useless: bailif (bailif)
 (not hall, etc.), battle (batl), written (writn), traveller (traveler), etc.
- d.—Change d and ed final to t when so pronounced, as in looked (lookt), etc., unless the e affects the preceding sound, as in chafed, etc.
- gh, ph.—Change gh and ph to f when so sounded: enough (enuf), laughter (lafter), phonetic (fonetic), etc.
- s.— Change s to z when so sounded, especially in distinctiv words and in -ise: abuse, verb (abuse), advertise (advertize), etc.
- 10. t.— Drop t in tch: catch (each), pitch (pich), etc.

In the foregoing list of authorities those titles have been generally omitted which are cited in the Dictionary in full or in a self-explanatory form—especially the titles of daily newspapers, of numerous scientific periodicals, and of "Proceedings" and "Transactions" of learned societies.

SUPPLEMENTARY NOTE TO PREFACE.

DURING the publication of the dictionary but one change has occurred in the staff of specialists mentioned in the preface issued with the first part. While the proofs of "T" were coming from the press, Dr. James K. Thacher, who had labored upon the dictionary from its beginning, died, leaving his work upon the last letters of the alphabet unfinished. The task of completing it was taken up by Dr. Thomas L. Stedman, and has been carried through by him.

The dictionary has also received additional aid from many others not mentioned in the preface. Help has thus been given most notably by Prof. Charles A. Young, in many important definitions (in particular those of the words sun, solar, telescope, and lens) and in continuous criticism of the final proofs; by Prof. Thomas Gray, of Rose Polytechnic Institute, in electrical definitions; by Mr. George E. Curtis, of the Smithsonian Institution, and Prof. Cleveland Abbe, in definitions of meteorological terms; by Mr. Edward S. Burgess, Mr. E. S. Steele of the National Museum, Mr. F. V. Coville of the United States Department of Agriculture, Prof. N. L. Britton of Columbia College, and the late Dr. J. I. Northrop, also of Columbia, in botany; by Mr. Leicester Allen, in definitions of mechanical terms; by Prof. S. W. Williston, of the University of Kansas, in medicine and physiology; by Dr. Theobald Smith, of the United States Department of Agriculture, in veterinary pathology and surgery; by Lieut. Arthur P. Nazro, in naval and nautical definitions; by ('apt. John W. Collins, of the United States Fish Commission, in material relating to fishing and the fisheries; by Prof. William H. Brewer, of Yale University, in many definitions, particularly those of the gaits of horses; by Mr. A. D. Risteen, in certain mathematical definitions; by Rev. George T. Packard, in the preliminary arrangement of certain literary material; by Mr. Austin Dobson, in the definitions of the names of various forms of verse; by Prof. Douglas Sladen, in the collection of Australian provincialisms and colloquialisms; and in various special matters by Dr. Edward Eggleston, Mr. George Kennan, Mr. George W. Cable, Mr. G. W. Pettes, and many others.

The staff of editorial assistants has been enlarged by the addition of Miss Katharine G. Brewster, and of Rev. George M'Arthur, to whom special recognition is due for his efficient revision of the final proofs.
